

2020 DIETARY GUIDELINES ADVISORY COMMITTEE

+ + + + +

PUBLIC MEETING

+ + + + +

THURSDAY
JANUARY 23, 2020

+ + + + +

The Dietary Guidelines Advisory Committee met in the Agricultural Research Service, Children's Nutrition Research Center, 1100 Bates Street, Houston, Texas, at 9:00 a.m., Barbara Schneeman, Chair, presiding. The meeting allowed for public viewing, both in-person and by webcast.

MEMBERS PRESENT

DR. BARBARA SCHNEEMAN, PhD, Chair
 DR. RONALD KLEINMAN, MD, Vice Chair
 DR. JAMY ARD, MD, Member
 DR. REGAN BAILEY, PhD, MPH, RD, Member
 DR. LYDIA BAZZANO, MD, PhD, Member
 DR. CAROL BOUSHEY, PhD, MPH, RD, Member
 DR. TERESA DAVIS, PhD, Member
 DR. KATHRYN DEWEY, PhD, Member
 DR. SHARON DONOVAN, PhD, RD, Member
 DR. STEVEN HEYMSFIELD, MD, Member
 DR. HEATHER LEIDY, PhD, Member
 DR. RICHARD MATTES, PhD, MPH, RD, Member
 DR. ELIZABETH MAYER-DAVIS, PhD, RD, Member
 DR. TIMOTHY NAIMI, MD, MPH, Member
 DR. RACHEL NOVOTNY, PhD, RDN, LD, Member
 DR. JOAN SABATÉ, MD, DrPH, Member
 DR. LINDA SNETSELAAR, PhD, RD, Member
 DR. JAMIE STANG, PhD, MPH, RD, Member
 DR. ELSIE TAVERAS, MD, MPH, Member

CONTENTS

Call to Order and Opening Remarks	3
Chair Remarks	17
Barbara Schneeman, PhD	
Subcommittee Updates	
Birth to 24 Months Subcommittee	31
Pregnancy and Lactation Subcommittee.....	87
Sharon Donovan, PhD, RD	
Dietary Fats and Seafood Subcommittee	134
Linda Snetselaar, PhD, RD	
Beverages and Added Sugars Subcommittee	175
Elizabeth Mayer-Davis, PhD, MSPH, RD	
Data Analysis and Food Pattern Modeling	205
Megan Bailey, PhD, MPH, RD	
Committee Discussion	270
Facilitated by Barbara Schneeman, PhD, Chair, and Ronald Kleinman, MD, Vice Chair	
Adjourn	292

1 P-R-O-C-E-E-D-I-N-G-S

2 9:03 a.m.

3 DR. STODY: Okay. Good morning. My
4 name is Eve Stody, and I'm a Lead Nutritionist for
5 Nutrition Guidance at USDA Center for Nutrition
6 Policy and Promotion, and I'm also the designated
7 federal officer for this 2020 Dietary Guidelines
8 Advisory Committee.

9 It is really my pleasure to welcome you
10 to meeting four of the 2020 Committee and also to
11 welcome you to Texas. We are holding this meeting
12 at the USDA Agricultural Research Service
13 Children's Nutrition Research Center in Houston,
14 Texas, and thanks to Dr. Denny Bier and their team
15 for really welcoming us and for being fantastic
16 hosts for this event.

17 This is the second time that the Dietary
18 Guidelines Advisory Committee has met outside of
19 the Washington, D.C., and the first time was over
20 25 years ago.

21 We also want to welcome all of you who
22 are joining us on YouTube. This meeting, like our

1 previous meetings, will be live-streamed. That
2 means -- hello, I would like to see the slides.

3 So this meeting will be live-streamed.
4 There will be -- and just a note that there will
5 be different links for the morning and afternoon;
6 that's the nature of YouTube. So for those of you
7 who are joining us online, when you registered, in
8 your registration email you should have received
9 four links, two for today and two for tomorrow.

10 We'll try to remind you to change links
11 after lunch. So we are very happy to have 19 of
12 our 20 members here with us today. Unfortunately,
13 Dr. Linda Van Horn was not able to join us here in
14 person, but she is going to join us remotely as much
15 as she is able.

16 We have about 1,000 people who have
17 registered for this meeting, with about 150 who
18 will join us at some point in person here in
19 Houston. And as always, I just thank you for your
20 interest and your support of the Dietary
21 Guidelines.

22 So just a little bit of background and

1 a reminder: The 2020 Committee was established to
2 conduct an independent review of current research
3 on nutrition and health to be considered by the
4 Departments of Agriculture and Health and Human
5 Services, and the development of the 2020-2025
6 Dietary Guidelines for Americans.

7 This Committee was selected by
8 Secretaries Purdue and Azar from USDA and HHS from
9 nominations received from the public, and they were
10 selected based on their education, experience, and
11 expertise, and they were balanced on a number of
12 factors, including things like geographic
13 locations.

14 The Committee was announced in February
15 2019. And just as a reminder, this is not a
16 committee is convened to provide expert opinions
17 or to represent a specific viewpoint, but rather
18 they were selected as independent scientists who
19 will work together to review current evidence on
20 diet and health.

21 Since this is a federal advisory
22 committee, the federal government is required to

1 outline the duties -- the missions and specific
2 duties of the Committee, and we have done this
3 through our charge to the Dietary Guidelines
4 Advisory Committee.

5 You can see this charge on our slide.
6 We presented it every meeting, and it's also on our
7 website, and their charge is to examine the
8 evidence on specific topics and scientific
9 questions identified by the Departments, and I'll
10 talk about those here more in the next few slides,
11 to develop a report that outlines their
12 science-based review and recommendations to the
13 Department with rationale, and then to submit the
14 report to the Secretaries of USDA and HHS for
15 consideration as the Departments develop the next
16 edition of the Dietary Guidelines.

17 So as we've talked about previously,
18 USDA and HHS added a new step to this process to
19 identify the specific topics or the specific
20 questions that the Advisory Committee were asked
21 to address.

22 In the past, we did outline some topic

1 areas, but in general the Committee identified the
2 specific questions that they would consider. For
3 this Committee, we added the step for the Committee
4 where the Departments identified those topics and
5 questions and asked the Committee to address those.

6 We did this for a number of reasons.
7 One, it was in part due to recommendations from the
8 National Academies on our process to kind of have
9 the question development occur in a separate step,
10 and we also really felt like it permitted a more
11 transparent, inclusive, and deliberate process.

12 And I do want to note that the topics
13 and questions were not developed in isolation.
14 The process was led by the Center for Nutrition
15 Policy and Promotion at USDA and the Office of
16 Disease Prevention and Health Promotion, our
17 partners at HHS, but it did include input from a
18 number of federal agencies, as well as
19 consideration of thousands of public comments.

20 And so in that process, specifically
21 CNPP and ODPHP developed an initial list with input
22 from some of our federal partners, we posted a list

1 of topics and questions for public comment for 30
2 days.

3 We received about 6,000 public comments
4 on those topics and questions and refined the list,
5 based on that input. We did prioritize the topics
6 and questions using four criteria: relevance to
7 the Dietary Guidelines -- and I'll talk more about
8 that in just a second; importance to public health;
9 potential impact on the federal programs and
10 policies that we inform; and avoiding duplication
11 of other federal efforts.

12 Now, as I think everyone in this room
13 knows, in the field of nutrition, there are many
14 possible questions of scientific and public input
15 that have the potential to be explored. So this
16 includes things on food groups, on very specific
17 foods, questions on nutrients, food safety, food
18 labeling, menu labeling, food settings, food
19 policies, food behaviors, medical nutrition
20 therapy, and more.

21 And we really feel like the Dietary
22 Guidelines have an important slice of that

1 nutrition conversation. The Dietary Guidelines
2 have a specific goal and a specific time line, and
3 that is to provide food-based dietary guidance to
4 the general public at least every five years.

5 Now, we do have a number of partners who
6 we work with kind of in this larger nutrition
7 conversation. So for example, the National
8 Academies developed the nutrient recommendations
9 known as the Dietary Reference Intakes, and there
10 are a number of federal agencies and others
11 involved in this space, including the Department
12 of Health and Human Services, Food and Drug
13 Administration, who work on food safety and
14 labeling issues, but the point being here that
15 there's a lot of pieces, and the hope is that we
16 all work together to kind of speak to the bigger
17 nutrition picture.

18 Now, the topics and scientific
19 questions we've asked the Committee to address
20 focus on diet and health across the lifespan, and
21 so kind of the main emphasis for this, I would say,
22 is about that emphasis on the lifespan.

1 The topics and questions we asked the
2 Committee to address build on topics and questions
3 examined by previous dietary guidelines -- Dietary
4 Guidelines Advisory Committees, I should say.

5 So we didn't start from scratch. We
6 had a lot to work with from our previous committees.
7 For example, the 2015 Committee did a number of
8 questions on dietary patterns and added sugars.

9 The 2010 Committee had a number of
10 specific questions on seafood and alcohol. A
11 number of committees have addressed kind of
12 elements of dietary fats, beverages and patterns
13 of eating, perhaps not as -- in kind of a broader
14 scope, but in pieces of it.

15 Previous committees have also
16 described current intakes of Americans, as well as
17 status of health across the American population,
18 which will be talked about today. And since 2005,
19 advisory committees have conducted food pattern
20 modeling analysis.

21 So that's kind of the exposure element.
22 In terms of the outcome, the Committee was asked

1 to consider a range of outcomes. So many previous
2 advisory committees have looked at the outcomes of
3 body weight or obesity, cardiovascular disease,
4 type 2 diabetes and cancer, and we asked the
5 Committee to examine those in kind of that health
6 discussion, but also some additional outcomes, so
7 for example, neurocognitive health has become
8 really a more recent interest in nutrition science.

9 So we did include brain health as part
10 of many of the questions that the Committee were
11 asked to consider. Sarcopenia, in particular,
12 trying to think about the older adult population
13 and having more targeted outcomes for that
14 population.

15 Bone health, which is of course
16 important for the older adults, but also children
17 and adolescents, as well as actual all-cause
18 mortality. We actually haven't had many
19 committees that considered that broader all-cause
20 mortality outcome.

21 Now, each committee that we've had also
22 looks at some unique topic areas, and for 2020

1 process, these are the birth to 24 months
2 performance population. There has been a growing
3 interest in us including this population.

4 Traditional dietary guidance has
5 focused on two years and older. And then the 2014
6 Farm Bill really solidified that inclusion in this
7 edition.

8 And then an expanded focus on pregnancy
9 and lactation. Previous advisory committees
10 hadn't necessarily excluded pregnancy and
11 lactation, but they hadn't had as focused questions
12 on pregnancy and lactation, and perhaps more
13 specific, they hadn't really considered outcomes
14 related to pregnancy and lactation. And so that's
15 been an addition here as well, and both of those
16 are no small additions, as you'll hear today
17 shortly.

18 So in summary, I would say that there
19 are many similarities between the work of this
20 Committee and previous advisory committees, but
21 there are some new topics.

22 I think a lot of what we've been seeing

1 is that a lot of the questions are more expanded,
2 so they're kind of the similar concept areas that
3 kind of broader exposure to more outcomes, and
4 there also are, of course, the new populations.

5 Now, as we've talked about previously,
6 and as with all of our Dietary Guidelines Advisory
7 Committees, the Committee's task is time-limited.
8 As we've discussed, USDA and HHS requested the
9 Committee to report by May 2020, and that is so the
10 Departments can meet our mandate to release the new
11 edition of the Dietary Guidelines within five
12 years, which is by December of this year, December
13 of 2020.

14 So as we move into the last phase of the
15 Committee's work, which is pretty crazy to think,
16 it's similar to previous committees. The 2020
17 Committee and federal staff have been working to
18 refine, streamline, and prioritize the remaining
19 work within the remaining time, and you'll hear
20 more about that over course of the next few days.

21 So all meetings of the full Committee
22 are open to the public. As I noted, this is the

1 fourth meeting. If you were not able to join us
2 for meetings one, two, and three, that information
3 is archived on our website, including the
4 recordings of the meetings, as well as
5 presentations, transcripts, and minutes.

6 Similar to the second meeting, this
7 meeting will include an opportunity for
8 individuals who had registered to provide oral
9 comments to the Committee. However, if you did not
10 have the opportunity to travel here to provide
11 public comments in person, the written public
12 comment period is always open.

13 We opened it in March of 2019, and it
14 will stay open into May of 2020. So this meeting
15 will be held today and tomorrow from 9:00 a.m. until
16 4:30 p.m. Central. I just note that because we
17 usually function on Eastern Time, and some of us
18 arrived early today, thinking we were still there.

19 So -- but we'll be on -- the meeting
20 will be in Central Time. The agenda is available
21 at DietaryGuidelines.gov, and Dr. Schneeman will
22 give an overview of the agenda in her remarks.

1 We do want to announce today that we
2 will host a -- the Committee will host a meeting
3 on its report on May 11, which is a Monday. This
4 will be a meeting -- you know, as we just talked
5 about, we've asked for the Committee's report in
6 May.

7 Their last meeting was scheduled for
8 March, and we wanted to provide the Committee an
9 opportunity to come together to discuss its final
10 recommendations and refine its report, but also for
11 the public to be able to hear some of the discussion
12 around the Committee's final recommendations
13 before they submit their report to the Departments.

14 This is the first time that we have
15 hosted a meeting specifically focused on the
16 Committee's report, and we hope that it is kind of
17 helpful in hearing firsthand about their
18 recommendations before they submit the report.

19 So we'll provide more information about
20 this. We will publish this in the Federal
21 Register. We'll include information on our
22 website. We'll send out listserv messages for

1 those of you who have signed up as we have more
2 information, but for now, please save the date for
3 Monday, May 11. This meeting will be held by
4 webinar only. We will not have -- there won't
5 travel for that meeting.

6 So we encourage you to follow along at
7 DietaryGuidelines.gov in between the meetings, as
8 well as here today. The Committee will talk about
9 a number of different questions that they are
10 reviewing. If you want more information about the
11 questions that they are talking about, you can to
12 go DietaryGuidelines.gov.

13 There is a rotating banner in the middle
14 of that page, the orange banner there, and if you
15 click on "View Protocols," it will take you to a
16 list -- a website with a list of questions, and if
17 you click on your question of interest, then it will
18 take you a webpage devoted to the Committee's
19 review on that question. So if you have something
20 of interest that you really want to learn more
21 about, we encourage you to go to the website.

22 So with that, I turn it over to the Chair

1 of the Committee, Dr. Barbara Schneeman.

2 CHAIR SCHNEEMAN: Thank you, Eve, and
3 let me add my welcome, certainly, to the Committee
4 members. It's great to see you all, and a full -- a
5 fairly full representation from the Committee, and
6 also to the attendees who are in the room, but also
7 to all of those who are listening on the webinar.

8 We do appreciate the interest in the
9 Dietary Guideline process and the work of this
10 Advisory Committee. And I want to extend a special
11 thank you to the CNRC for hosting the Committee
12 here.

13 I see Dr. Bier sitting over here on the
14 side. Thank you very much for the invitation to
15 be here, and the staff has been fantastic in terms
16 of helping us and making sure that things went
17 smoothly.

18 So thank you. So I will move into the
19 slides. So let me start, first of all, by just
20 giving you an overview. Sort of following on from
21 what Dr. Stody presented, I'm going to talk more
22 specifically about our subcommittee structure, our

1 approaches to examining evidence and the
2 information to be discussed at this meeting.

3 In a sense, I'm now going to talk more
4 about how this Committee has moved forward with the
5 charge that we received from USDA and HHS. So
6 we'll look at the subcommittee status and the
7 agenda for this meeting.

8 So just to remind you, these are the
9 subcommittee structures that were set up, so that
10 between the -- in the time between the public
11 meetings, work can proceed, and we have six
12 subcommittees and one cross-cutting.

13 I know the font is small there.
14 Dietary Patterns, Pregnancy and Lactation, Birth
15 to 24 Months, Beverages and Added Sugars, Dietary
16 Fats and Seafood, and Frequency of Eating, and the
17 cross-cutting group is the Data Analysis and Food
18 Pattern Modeling subcommittee, so aligned with
19 those topics that you've heard.

20 And I'm not going to read out the names,
21 because as we go through the subcommittee reports,
22 you will be getting that information. Just to

1 remind you that the subcommittees review the
2 evidence and provide advice to the parent
3 Committee, so the final decisions are being made
4 by the full Committee, and they're done in this
5 public meeting format, which we'll be having today
6 and tomorrow.

7 So just, again, we've talked about that
8 this each meeting, how the Committee approaches the
9 review of the evidence, the examination of the
10 evidence, and we use three approaches to examine
11 the evidence: data analysis, food pattern
12 modeling, and the NESR systematic reviews.

13 And each of these scientific approaches
14 has a protocol, and the protocol is a plan for how
15 one of the scientific approaches will be used to
16 examine evidence related to one of the questions
17 that the Committee has been asked to address.

18 As they've been developed, each of the
19 protocols are available, and Dr. Stody gave you
20 the web link for that. And we -- in posting the
21 posting the protocols, we have invited feedback
22 from the public, and we found that feedback to be

1 very helpful. People have provided additional
2 references for additional consideration.

3 So information on the approaches and
4 the protocols have been presented at previous
5 meetings, and additional information that is
6 available at the DietaryGuidelines.gov.

7 So in the next few slides, I'm going to
8 just go through a brief overview of the information
9 to be presented by the subcommittee so you see the
10 general format of how each of the subcommittee's
11 reports is structured.

12 So throughout the presentations, you
13 will see an analytic framework which defines the
14 core elements of the diet and health relationship
15 to be examined. So you can see that that analytic
16 framework includes the intervention, exposures,
17 and the comparators that will be used.

18 In some cases, we have intermediate
19 outcomes -- obviously we're very interested in the
20 health outcomes when available for our
21 review -- then key factors that could impact the
22 relationship; confounders, covariates, moderators

1 are specified in the analytical framework, and also
2 key definitions are given.

3 So each of the protocols also look at
4 inclusion and exclusion criteria. And so you will
5 hear discussion of those criteria in each of the
6 systematic reviews, and these criteria are
7 developed up front and are used to screen the
8 articles that will be included or excluded from a
9 review.

10 So there are a number of standard
11 criteria that apply across the different reviews
12 that the subcommittees have used consistently
13 across the reviews, and so these include areas such
14 as the study design.

15 And I'm not going to read all of the
16 inclusion/exclusion, because we have talked about
17 these at each of the public meetings, and it's also
18 available -- completely available to you on the
19 DietaryGuidelines.gov.

20 So standard inclusion criteria include
21 that study design, what kinds of studies are
22 included, what are excluded, the publication

1 status, peer-reviewed articles, the language of
2 publication -- English is what we've
3 included -- the country of origin or the country
4 that studied very high or high human development
5 so it's comparable to the U.S. population and can
6 be generalized to the U.S. population. And then
7 the study participants. We're primarily
8 interested in studies in humans, males and females,
9 and so exclude animal or in vitro studies.

10 In addition, the health status of the
11 study participants is included in our inclusion and
12 exclusion criteria, and generally you'll see that,
13 while we're obviously interested in participants
14 who are healthy, we do also include participants
15 who may be at risk for chronic disease, including
16 those with obesity, and so that concept applies.

17 What we're excluding are studies in
18 which the participants have been diagnosed with a
19 disease or hospitalized and that -- or
20 participants with the outcome of interest that
21 we're looking at, and so they're in a treatment
22 study, or infants who were born preterm or low birth

1 weight. So that sets up what we include versus
2 what we exclude in terms of health status.

3 Now, some of the criteria need to be
4 tailored to the specific review, and those kind of
5 tailored criteria might include diet-related
6 interventions or an exposure of interest; health
7 outcomes; the endpoint and/or an intermediate,
8 whether or not that data are available; the date
9 of publication, depending on what we already have
10 from previous versions of the Dietary Guidelines;
11 the work of other advisory committees; the size of
12 the study groups; study duration; and the age of
13 the study participants. And so those will be
14 clearly specified in the protocols that are
15 published.

16 So in the NESR systematic reviews, what
17 you will -- because we're now moving into that
18 phase where the subcommittees have been doing their
19 work, and they are presenting more than the
20 protocols; they're moving into presenting their
21 draft conclusions -- you'll see a flow chart of the
22 literature search and screening results, a

1 description of the evidence that is being examined
2 in depth by the subcommittee, the summary of the
3 evidence synthesis, and some draft conclusion
4 statements and grades for those particular
5 questions.

6 And I do want to highlight that what
7 we're going to be presenting, just in the interest
8 of time, are in fact summary statements. The
9 Committee's review includes a much more detailed
10 discussion and review of the included articles,
11 which will be provided in the Committee's final
12 report and supporting online materials.

13 The intent is to summarize the
14 information today and tomorrow for discussion
15 across the full Committee. And again, a lot of
16 what we're doing now, because it does involve a
17 Committee discussion, we're presenting things that
18 are in their draft format and it will only be
19 finalized once we submit our report.

20 So there will be data analysis
21 questions that are presented today, and they
22 include -- they also follow a protocol and may

1 include some similar elements, including the
2 analytical framework, the analytical plan, the
3 results, and then draft conclusion statements that
4 the Committee will be discussing today.

5 So for both the NESR systematic reviews
6 and the data analysis questions discussed today and
7 tomorrow, conclusion statements -- draft
8 conclusion statements will be presented, and so
9 that draft conclusion statement is an answer to the
10 question of the evidence that is being reviewed.

11 They have been drafted by the
12 subcommittees, and they're being brought to the
13 full Committee for discussion at these public
14 meetings. And again, these are considered draft
15 until the Committee submits its report to the
16 Secretaries, so they shouldn't be interpreted as
17 the Committee's final view or recommendations. The
18 Committee is working toward its final decisions.

19 So I do want to note that after the
20 conclusion statements are discussed by the
21 Committee at the public meetings, the systematic
22 reviews will go through a peer-review process, and

1 that is being coordinated by USDA's Agricultural
2 Research Service, so that these reviews will be
3 peer-reviewed before the Committee finalizes.

4 And we have, in fact, invited Dr. David
5 Klurfeld from ARS to provide remarks at the next
6 meeting, the March meeting, on the process that is
7 being used for the peer-review process.

8 And we will then post the draft
9 conclusion statements online after that peer
10 review is completed. So you'll be learning more
11 about that as we move forward, and that is a new
12 part of the DGAC process, so we're learning about
13 it as we go.

14 So subcommittee status. They're -- I
15 just want to summarize so you understand the full
16 scope of the work. I can assure you that the
17 subcommittees have been very busy, and there's a
18 lot of demand in terms of time.

19 I also would note that I know everyone
20 on this Committee is fully appreciative of the
21 excellent staff that has been working with us,
22 keeping us on schedule, keeping us on track, and

1 doing the tremendous of work that it takes to pull
2 the evidence together so that the Committee can do
3 its evaluation.

4 So if we could go back to that slide,
5 please? So just the draft conclusions for
6 approximately 30 questions will be presented at
7 this meeting, including both NESR's systematic
8 reviews and data analysis evaluation.

9 And so across the subcommittees, NESR
10 has screened over 265,000 articles and extracted
11 data and assessed risk of bias for over 500
12 articles. And I can assure you those numbers will
13 only still grow as we keep moving forward.

14 We are utilizing nearly 50 different
15 types of data analysis from the NHANES What We Eat
16 in America. We have begun to work on the food
17 pattern modeling, and we've refined a report
18 outline and are beginning to prepare some of the
19 report content.

20 So the task at hand is large. There's
21 a huge amount of work that has been done. We know
22 that there's still a huge amount of work to be done.

1 So members and staff, members of the Committee and
2 the staff have been working to refine, streamline,
3 and prioritize the remaining work so that we can
4 meet the timeline.

5 So in our meeting number four, the
6 meeting that we're at, we'll describe the status
7 and provide updates on the work of the Committee.
8 As Dr. Stoody noted, there's an agenda available
9 at DietaryGuidelines.gov.

10 So just to make sure we -- sort of make
11 sure we connect with our YouTube participants,
12 we'll be sure that the meeting begins at 9:00 a.m.
13 Central Time, and the afternoon session will begin
14 at 1:00 p.m. Central Time.

15 Breaks, however, can't really be set at
16 a specific time, because of the nature of the
17 reporting that we're doing, but we'll take breaks
18 as they fit within the discussion framework.

19 So for today's agenda, following the
20 opening remarks, we'll start with the subcommittee
21 updates, and the subcommittees we expect to hear
22 from today are Birth to 24, Pregnancy and

1 Lactation, Dietary Fats and Seafood, Beverages and
2 Added Sugar, and the Data Analysis and Food Pattern
3 Modeling, the cross-cutting working group, and
4 obviously, with each of those subcommittees, we
5 anticipate there will be Committee discussion.

6 So for tomorrow's agenda, again, we'll
7 start at 9:00 a.m., and the subcommittee updates
8 that will be held tomorrow are the Dietary Pattern
9 subcommittee, the Frequency of Eating, some
10 Committee discussion, and then we've also
11 scheduled public comments, which will take place
12 in the afternoon, and we are looking forward to
13 those public comments.

14 And just to note that, yes, there's been
15 a lot of interest in the DGAC work. The Committee
16 has received approximately 17,775 written public
17 comments, since the work began.

18 If there's interest in commenting on
19 the new protocols that are presented in today and
20 tomorrow's public meetings, it's most useful to the
21 Committee if those comments on the protocols are
22 received by Friday, February 7.

1 And again, we've found the comments on
2 the protocols to be helpful, but for the Committee
3 to keep progressing with its work, we need them by
4 February 7. But as noted by Dr. Stoody, the
5 written public comment period for more general
6 comments is open until we complete our work in May
7 of 2020.

8 So with that, that concludes my
9 comments, and I'll just turn to the Committee
10 members just to see if there's anything, question
11 or comments that any Committee members may want to
12 make?

13 (No response.)

14 CHAIR SCHNEEMAN: So with that, I'm
15 going to -- Dr. Kleinman, you may have some
16 comments as well, but I'll turn it over to you for
17 the first subcommittee reports.

18 VICE CHAIR KLEINMAN: Thank you.
19 Thanks, Barbara. That was very complete, and I
20 have very little to add. This is our fourth
21 meeting together, and so it's an opportunity for
22 us all to be here with each of the subcommittees

1 that's been working on, and a great deal of work
2 has taken place since the last meeting, so the
3 remainder of the day today and tomorrow will be
4 these report outs of the subcommittees.

5 I think we'll go right into the first
6 one now and then in terms of breaks, we recognize
7 that there are some biological imperatives here,
8 and so we will try to take a brief break, perhaps,
9 between the first and second.

10 So with that, I'm going to go ahead and
11 turn this over to Kay Dewey, and she will talk
12 about the subcommittee for Birth to 24 Months.

13 MEMBER DEWEY: Thank you very much, Ron
14 and Barbara. I am very pleased to be able to report
15 to you today on behalf of this subcommittee. And
16 the members of this subcommittee have been working
17 very hard, many hours every week, to get to this
18 point.

19 We have a number of questions that have
20 been addressed, and the NESR staff have been
21 extremely busy screening the literature, preparing
22 the results, extracting the data, and preparing

1 evidence portfolios for us to review.

2 And so today we will be presenting draft
3 conclusion statements for the eight topics shown
4 here. Although it's eight topics, there are
5 66 conclusion statements we need to go through, and
6 if I did read every single one of them in full, it
7 would take more than an hour.

8 So I'm going to try to go through them
9 as quickly as I can, while not skipping anything
10 important. Those include three questions or
11 topics on the relationship between human milk and
12 infant formula and three outcome areas:
13 micronutrient status, atopic disease, and
14 long-term health outcomes.

15 Then there are five questions on
16 complementary feeding, and five outcome areas:
17 atopic disease, developmental milestones, growth,
18 size, and body composition, micronutrient status
19 and bone health.

20 We still have work to do for five other
21 topics that are listed here, two additional
22 questions related to human milk and infant formula,

1 and those relate to growth, size, and body
2 composition and developmental milestones.

3 And then the three new questions that
4 we have on nutrients from supplements or fortified
5 foods, and three outcome domains: growth, size and
6 body composition, bone health and micronutrient
7 status.

8 These are some of the key definitions
9 for our reviews, which we have presented
10 previously, but to remind you of those and the scope
11 of the questions we're investigating, I wanted to
12 go through them.

13 Human milk refers to mother's own milk,
14 so our reviews did not include examinations of
15 donor milk. And we've used the term human milk
16 feeding, instead of breastfeeding, to be clear that
17 we have examined human milk fed at the breast, as
18 well as human milk that has been expressed and fed
19 fresh or after refrigeration or freezing.

20 Infant formula refers to commercially
21 prepared infant formulas that meet FDA or Codex
22 Alimentarius standards. In practice, this has

1 been a tricky definition to apply because there are
2 a lot of studies that examine experimental infant
3 formulas with ingredients such as dietary
4 nucleotides or DHA, prior to putting them on the
5 market.

6 So we have included this evidence if the
7 formulas met the FDA or Codex standards. We did
8 this because we thought it was important to examine
9 infant formulas with ingredients that are
10 commercially available.

11 And lastly, complementary foods and
12 beverages refers to foods and beverages other than
13 human milk or infant formula. That includes
14 liquids, semisolids, and solids that are provided
15 to an infant or young child to provide nutrients
16 and energy.

17 I want to thank the public for
18 submitting comments on the work that was presented
19 during meeting three. We carefully reviewed and
20 discussed all of those comments, and we would very
21 much welcome public comments on what we present
22 today, as Dr. Schneeman mentioned, by February 7.

1 So to begin, I will review some draft
2 conclusions for the relationship between duration,
3 frequency, and volume of exclusive human milk
4 and/or infant formula consumption and
5 micronutrient status.

6 This is the analytical framework that
7 we developed that shows the scope of this question,
8 and we divided the duration, frequency, and volume
9 of exclusive milk, of human milk or infant formula,
10 into a series of four comparisons that align with
11 the first feeding decisions that caregivers make,
12 and those include whether or not to feed human milk;
13 and then, for caregivers who do decide to do so,
14 how long to feed human milk, so the duration of
15 human milk consumption, and then how long to feed
16 human milk exclusively.

17 So you'll note that we examined
18 exclusive human milk consumption prior to the
19 introduction of infant formula only, and that's to
20 avoid overlap with another review which we will
21 also present today that examines the timing of the
22 introduction of complementary foods and beverages.

1 And then if caregivers have decided to
2 supplement human milk with infant formula, our
3 final comparison examines the intensity or
4 proportion or amount of human milk that is fed to
5 mixed-fed infants.

6 And then on the right, you can see that
7 we examined iron, zinc, iodine, vitamins C and B12,
8 and fatty acid status from birth to 24 months.

9 This flow chart shows the literature review and
10 screening results, and we used two different
11 literature searches which are noted with the
12 letters A and B in the flow chart.

13 Literature Search A was from the
14 Pregnancy and Birth to 24 Months Project, which
15 used a search date range of January 1980 to March
16 2016, and this literature search was very large,
17 because it was intended to find studies for several
18 questions related to human milk and infant formula.

19 Literature Search B was smaller,
20 because it was intended to capture just the
21 literature published in the last three years. And
22 you can see that ultimately 23 articles were

1 identified that met the inclusion criteria for the
2 question about feeding human milk and infant
3 formula and micronutrient status outcomes.

4 On this slide, we want to give you a
5 snapshot of the evidence by showing how many of
6 those 23 studies provided evidence for each
7 component of our analytical framework. And you
8 can see that where there was evidence to address
9 a topic, the number of studies was small.

10 Now, a small number of studies may
11 provide sufficient evidence to determine
12 associations, for example, if the evidence is
13 consistent and has a low risk of bias. However,
14 that was generally not the case in this body of
15 evidence.

16 You can also see the majority of
17 evidence addressed ever, compared with never,
18 consuming human milk. So we'll go one by one
19 through those comparisons.

20 This is the evidence related to ever
21 versus never consuming human milk, and these were
22 generally studies that compare infants who were fed

1 human milk with infants who were fed infant formula
2 that had a novel composition at the time of the
3 study, such as added DHA or different levels of
4 iron, and infants who were fed conventional infant
5 formula.

6 Now, as you can imagine, the evidence
7 would show that the formula's composition can
8 impact nutrient status outcomes. For example,
9 formula with DHA can impact DHA status, and this
10 complicates our synthesis of the evidence, because
11 infants in the studies were fed a wide variety of
12 infant formulas.

13 The 23 studies in this body of evidence
14 generally studied healthy full-term infants who
15 were recruited at or close to birth and who were
16 from the U.S. and several other countries.

17 As I've already mentioned, the majority
18 of evidence examines ever compared with never
19 consuming human milk and the duration of human milk
20 consumption. It's important to note that other
21 components of the infants' diets varied between
22 studies and also didn't tend to be well reported.

1 For example, the exclusivity of human
2 milk, the types and amount of formula fed in
3 addition to human milk, the types and amount of
4 complementary foods and beverages in addition to
5 human milk or infant formula, and any intake of
6 supplements.

7 At the bottom of the slide, you can see
8 the outcomes that were reported by the studies for
9 each of these nutrients. Now, there was evidence
10 available from a small number of studies, and
11 generally they did not show consistent
12 associations between the comparisons that are
13 shown in this slide.

14 So for ever -- compared with never
15 consuming human milk, there were not consistent
16 associations with anemia, hemoglobin, hematocrit
17 and the other indicators of iron status shown here,
18 or with zinc status.

19 Also, that was true for the duration of
20 any human milk consumption among infants fed human
21 milk, and anemia and markers of iron status, zinc
22 status, vitamin D status and fatty acid status.

1 And lastly, the same was true for the
2 duration of exclusive human milk consumption
3 before the introduction of infant formula and fatty
4 acid status.

5 The most substantial evidence that we
6 reviewed was from seven studies that examine the
7 relationship between ever compared with never
8 consuming human milk and fatty acid status.

9 And these studies indicated that there
10 may be an association between feeding human milk
11 compared with infant formula and fatty acid status.
12 And this body of evidence had an adequate number
13 of sufficiently powered studies, with some
14 inconsistencies that can likely be explained by
15 methodological differences; for example, the use
16 of formulas with different fatty acid composition.

17 There were several limitations that
18 included the risk of bias, especially confounding;
19 the study directness, because these studies are
20 mostly designed to examine the effects of infant
21 formula composition rather than to directly
22 compare infants fed human milk with those fed

1 infant formula.

2 And also generalizability. For
3 example, in two studies, there were no non-white
4 participants, and other studies did not report race
5 or ethnicity. Also, it's unclear whether the
6 experimental formulas are similar to current
7 formulas on the market in the U.S.

8 But we did draft a conclusion statement
9 regarding ever versus never consuming human milk,
10 and this states that moderate evidence indicates
11 that ever compared with never consuming human milk
12 may be associated with fatty acid status. The
13 difference in fatty acid status between infants who
14 are fed human milk and infant formula likely
15 depends on the fatty acid composition of the human
16 milk and the infant formula being compared.

17 We found insufficient evidence
18 available to determine the relationship between
19 ever compared with never consuming human milk and
20 iron and zinc status from birth to 24 months, and
21 no evidence for the relationship between ever
22 versus never consuming human milk and the other

1 micronutrient status outcomes: iodine, vitamin
2 B12 and vitamin D status.

3 Continuing on with regard to duration
4 of human milk feeding, insufficient evidence was
5 available to examine this relationship for iron,
6 zinc, vitamin D and fatty acid status, and there
7 was no evidence to determine that relationship for
8 iodine and vitamin B12 status.

9 In addition, regarding duration of
10 exclusive human milk consumption, there was
11 insufficient evidence for the relationship to
12 fatty acid status, and no evidence for the
13 relationship to iron, zinc, iodine, vitamin B12 and
14 vitamin D status.

15 And finally, with regard to intensity,
16 proportion or amount of human milk in mixed-fed
17 infants, there was no evidence to examine the
18 relationship to iron, zinc, iodine, B12, vitamin
19 D, or fatty acid status.

20 So next we will review the draft
21 conclusions for the relationship between duration
22 of exclusive human milk or infant formula

1 consumption, and food allergies and atopic
2 allergic diseases and long-term health outcomes.

3 Now, these questions have been answered
4 with existing NESR systematic reviews, and our
5 updated protocols, which are available at
6 DietaryGuidelines.gov, describe that we will use
7 these reviews as is, because they were completed
8 recently and capture over 35 years of evidence.
9 The papers from those reviews were published in the
10 American Journal of Clinical Nutrition in 2019.

11 However, we would like to ask the public
12 to please submit public comments if you know of any
13 articles published since 2016 that meet the
14 inclusion criteria and would also significantly
15 affect these conclusions.

16 The Committee did carefully review the
17 conclusion statements in the existing NESR
18 systematic reviews; and we flagged those that we
19 thought warranted an informal search to identify
20 new evidence that has emerged since 2016, focusing
21 on other published systematic reviews.

22 We did not locate any studies that would

1 have modified the conclusions, but again we do
2 appreciate any comment the public would like to
3 provide. So as I mentioned the Committee will be
4 answering these questions using the nine existing
5 NESR systematic reviews completed as part of the
6 Pregnancy and Birth to 24 Months Project by the
7 Infant Milk-Feeding Practices Technical Expert
8 Collaborative, and the link to the documentation
9 is provided here.

10 We would like to sincerely acknowledge
11 the work of this group of scientists who comprised
12 this technical expert collaborative and conducted
13 these reviews with NESR.

14 For this set of reviews, the literature
15 search was conducted between January 1980 and March
16 2016. For never versus ever feeding human milk and
17 atopic disease, 44 articles met the inclusion
18 criteria, and you can see the distribution of the
19 outcome that was examined. Almost all of this
20 evidence was from observational studies.

21 For duration of any human milk feeding
22 and atopic disease, 35 articles met the criteria,

1 and almost all the evidence was from observational
2 studies.

3 For duration of exclusive human milk
4 feeding prior to the introduction of infant
5 formula, only one article met the inclusion
6 criteria.

7 This summarizes what was concluded
8 regarding the relationship between never versus
9 ever feeding human milk and these outcomes.
10 Firstly, moderate evidence suggests that never, in
11 comparison to ever being fed human milk, is
12 associated with a higher risk of childhood asthma.

13 Again, just to emphasize, these
14 statements are worded so that the risk is related
15 to never feeding human milk. And in this case,
16 there were 17 independent studies contributing to
17 that conclusion statement.

18 For the second one, limited evidence
19 does not suggest a relationship between never
20 versus ever being fed human milk and atopic
21 dermatitis in childhood.

22 For the other relationships, evidence

1 about never versus ever being fed human milk and
2 atopic dermatitis was inconclusive, and there was
3 insufficient evidence to examine how it related to
4 the other outcomes that are listed here.

5 Again, I'm not going to read every word.
6 All of these statements are available in the
7 published articles.

8 This shows the conclusion statements
9 for the relationship between shorter versus longer
10 duration of any human milk feeding and these
11 outcomes.

12 Moderate evidence, mostly from
13 observational studies, suggests that among infants
14 fed human milk, a shorter versus a longer duration
15 of any human milk feeding is associated with a
16 higher risk of asthma in childhood and adolescence.
17 This included 20 independent studies.

18 Limited evidence does not suggest a
19 relationship between duration of any human milk
20 feeding and allergic rhinitis or atopic dermatitis
21 in childhood.

22 Evidence about the relationship

1 between shorter or longer duration of human milk
2 feeding and atopic dermatitis from birth to 24
3 months is inconclusive, and there's insufficient
4 evidence to determine the relationship with the
5 other outcomes in this set.

6 In terms of the shorter or longer
7 duration of exclusive human milk feeding before
8 introduction of infant formula, there is
9 insufficient evidence to examine this relationship
10 to all of the outcomes that were examined.

11 Moving on, then, to the long-term
12 outcomes, this shows the evidence that was
13 available to examine those. First, with regard to
14 never versus ever feeding human milk and
15 cardiovascular disease outcomes, there were 13
16 articles that met the inclusion criteria, and you
17 can see the types of outcomes that these studies
18 examined.

19 For duration of any human milk feeding,
20 there were 24 articles, and for duration of
21 exclusive human milk feeding and cardiovascular
22 disease outcomes, there were six articles

1 included.

2 So I'll go through those conclusion
3 statements as well. For never versus ever feeding
4 human milk, limited evidence suggests that never
5 versus ever being fed human milk is associated with
6 higher blood pressure, within a normal range, at
7 six to seven years of age.

8 The evidence about the relationship of
9 never versus ever being fed human milk with blood
10 lipids in childhood was inconclusive and there was
11 insufficient evidence for the relationship to the
12 other CVD outcomes examined.

13 In terms of shorter versus longer
14 duration of any human milk feeding, moderate
15 evidence suggests that there is no association
16 between the duration of any human milk feeding and
17 blood pressure in childhood.

18 And I wanted to call out one study here
19 that was quite important. There was compelling
20 evidence from the Promotion of Breastfeeding
21 Intervention trial that is the only randomized
22 trial in this body of evidence, and it showed no

1 significant relationship between duration of any
2 human milk feeding and blood pressure at six and
3 a half or 11-1/2 years of age.

4 There was also inconsistent evidence
5 across six independent prospective cohort studies.
6 The second bullet here, the evidence about the
7 relationship of shorter versus longer duration of
8 human milk with blood lipids in childhood and
9 adulthood and with metabolic syndrome, was
10 inconclusive, and there was insufficient evidence
11 to determine the relationship to the other CVD
12 outcomes.

13 Continuing on with shorter versus
14 longer duration, limited evidence suggests that
15 there is no association between the duration of
16 exclusive human milk feeding and blood pressure in
17 childhood or metabolic syndrome at 11.5 years of
18 age, and most of this evidence comes from this one
19 non-U.S. sample that was assessed using a very
20 strong study design.

21 And there was insufficient evidence to
22 determine the relationship of the duration of

1 exclusive human milk feeding with the other
2 endpoint CVD outcomes.

3 The other long-term outcome examined
4 was diabetes, and in this case, there were 21
5 articles that met the inclusion criteria for the
6 comparison of never versus ever feeding human milk.

7 You can see that most of those are
8 regard -- with regard to type 1 diabetes. For
9 duration of any human milk feeding and diabetes,
10 37 articles met the criteria, and 30 were focused
11 on type 1 diabetes.

12 For duration of exclusive human milk
13 feeding, there were 18 articles that met the
14 criteria; again, 17 about type 1 diabetes. So this
15 summarizes what was concluded about never versus
16 ever feeding human milk.

17 Limited evidence from observational
18 studies suggests that never versus ever being fed
19 human milk is associated with a higher risk of type
20 1 diabetes. There's insufficient evidence to
21 determine whether or not there is a relationship
22 between never versus ever feeding human milk and

1 type 2 diabetes, prediabetes and the other outcomes
2 shown here.

3 In terms of the duration of human milk
4 feeding, moderate evidence from observational
5 studies suggests that among infants fed some amount
6 of human milk, a shorter versus a longer duration
7 of human milk feeding is associated with a higher
8 risk of type 1 diabetes.

9 Limited but consistent evidence
10 suggests that the duration of any human milk
11 feeding is not associated with fasting glucose or
12 insulin resistance in childhood or during the
13 transition from childhood into adolescence. And
14 there's insufficient evidence for the relationship
15 to type 2 diabetes, prediabetes or the other
16 outcomes shown here.

17 And then in terms of shorter versus
18 longer duration of exclusive human milk feeding,
19 limited evidence from observational studies
20 suggests that a shorter duration is associated with
21 a higher risk of type 1 diabetes.

22 Limited evidence from a single study

1 that used the strong design also suggests that the
2 duration of exclusive human milk feeding is not
3 associated with fasting glucose or insulin
4 resistance at 11.5 years of age. And there's
5 insufficient evidence to determine the
6 relationship with type 2 diabetes, prediabetes and
7 the other outcomes shown here.

8 Moving on, next we'll review the draft
9 conclusions for the relationship between
10 complementary feeding and the five outcome domains
11 that are listed here: micronutrient status;
12 growth, size and body composition; developmental
13 milestones, including neurocognitive development;
14 food allergies and atopic allergic diseases; and
15 bone health.

16 These have also been answered with
17 existing NESR systematic reviews, and the
18 protocols again are at DietaryGuidelines.gov.

19 And we will be using these reviews as is, again,
20 because they were completed recently and capture
21 over 35 years of evidence.

22 These papers were also published in the

1 American Journal of Clinical Nutrition in 2019.
2 However, as mentioned previously, we would like to
3 ask the public to please submit public comments if
4 you know of any articles published since 2016 that
5 meet the inclusion criteria and would
6 significantly affect the conclusions that I will
7 be presenting.

8 So the Committee will be answering
9 these questions using 10 existing NESR systematic
10 reviews completed as part of the Pregnancy and
11 Birth to 24 Months Project by the Complementary
12 Feeding Technical Expert Collaborative, and this
13 gives the link for the complete documentation of
14 that work.

15 Again, we would like to acknowledge the
16 work of this group of scientists who comprise the
17 complementary feeding TEC, who conducted these
18 reviews with NESR. This literature search spanned
19 from January 1980 to July 2016.

20 For complementary foods and beverages,
21 they were divided into two overarching types of
22 questions: the timing of introduction of

1 complementary foods and beverages, and the types
2 of amounts.

3 So for this first set of outcomes, which
4 are micronutrient status, there were nine studies
5 that met the criteria for the timing of
6 introduction. Most of these examined iron status;
7 a few examined zinc, vitamin D, vitamin B12, folate
8 and/or fatty acid status. For the types and
9 amounts of complementary foods and beverages, 31
10 articles met the criteria. Most examined
11 iron-fortified cereals and meats with respect to
12 iron status. Several examined zinc and fatty acid
13 status. And very few studies examined vitamin D,
14 vitamin B12, and folate status.

15 So I'll begin with the relationship
16 between the timing of introduction of
17 complementary foods and beverages and
18 micronutrient status.

19 Moderate evidence suggests that
20 introducing complementary foods and beverages at
21 four months of age compared to six months of age
22 offers no long-term advantages or disadvantages in

1 terms of iron status among healthy, full-term
2 infants who are breastfed, fed iron-fortified
3 formula, or both. And there were nine studies that
4 met the criteria for this question.

5 There is not enough evidence to
6 determine the relationship between timing of
7 introduction and zinc, vitamin D, vitamin B12,
8 folate, or fatty acid status.

9 Additional factors that need to be
10 considered in examining the relationship between
11 the age at which complementary foods and beverages
12 are introduced and micronutrient status include
13 birth weight and timing of umbilical cord clamping,
14 both of which affect iron stores of the newborn;
15 postnatal growth; type of feeding, at the breast
16 or formula or mixed feeding; and intake and
17 absorption of iron from sources other than human
18 milk, including the types and amounts of
19 complementary foods and beverages being consumed.

20 This summarizes the conclusions for the
21 types and amounts of complementary foods and
22 micronutrient status. Thirty-one studies met the

1 inclusion criteria for this review. And strong
2 evidence suggests that consuming complementary
3 foods and beverages that contain substantial
4 amounts of iron, such as meats or iron-fortified
5 cereal, helps maintain adequate iron status or
6 prevent iron deficiency during the first year of
7 life among infants with insufficient iron stores
8 or breastfed infants who are not receiving adequate
9 iron from another source.

10 However, the benefit of these types of
11 complementary foods and beverages for infants with
12 sufficient iron stores, such as those consuming
13 iron-fortified infant formula, is less evident.

14 There's not enough evidence to
15 determine the relationship between other types and
16 amounts of complementary foods and beverages
17 containing lesser amounts of iron, such as fruits
18 and vegetables and iron status.

19 Then in terms of the other nutrients of
20 interest, limited evidence suggests that consuming
21 complementary foods and beverages that contain
22 substantial amounts of zinc, such as meats or

1 cereals fortified with zinc, support zinc status
2 during the first year of life, particularly among
3 breastfed infants who are not receiving adequate
4 zinc from another source.

5 However, the benefit of these types of
6 complementary foods for infants consuming
7 fortified infant formula is less evident.
8 Moderate evidence suggests that consuming
9 complementary foods and beverages with differing
10 fatty acid profiles, particularly long-chain
11 polyunsaturated fatty acids, can influence fatty
12 acid status.

13 Continuing on this theme, during the
14 second year of life, food sources of micronutrients
15 are still needed, but there's limited evidence to
16 indicate which types and amounts of complementary
17 foods and beverages are associated with adequate
18 micronutrient status, and there's not enough
19 evidence to determine the relationship between the
20 types and amounts of complementary foods and
21 beverages and vitamin B-12, vitamin D, or folate
22 status.

1 Now I'm going to move on to the next
2 outcome domain, and that is food allergies and
3 atopic allergic diseases. For the timing of
4 introduction of complementary foods and beverages,
5 31 studies met the inclusion criteria, and most of
6 them examined food allergies. For types and
7 amounts of complementary foods and beverages, 39
8 met the criteria and most examined the most common
9 allergenic foods.

10 This has to do with the timing of
11 introduction of complementary foods and beverages.
12 Moderate evidence suggests that there is no
13 relationship between the age at which
14 complementary feeding first begins and the risk of
15 developing food allergy, atopic dermatitis or
16 eczema, or asthma during childhood.

17 There's insufficient evidence to
18 determine the relationship between age at which
19 complementary foods or beverages are first
20 introduced and risk of developing allergic
21 rhinitis during childhood.

22 Now, the rest of the series of slides

1 focuses on the specific types of complementary
2 foods being introduced, and so these are divided
3 into several different slides.

4 I wanted to mention that the studies are
5 mostly focused on food allergy to that particular
6 food component. And in this case, we will be
7 talking about peanut, tree nuts and seeds.

8 There is strong evidence to suggest
9 that introducing peanut in the first year of life
10 after four months of age may reduce the risk of food
11 allergy to peanuts, and this evidence is strongest
12 for introducing peanut in infants at the highest
13 risk with severe atopic dermatitis and/or egg
14 allergy to prevent peanut allergy, but it is also
15 applicable to infants at lower risk.

16 However, the evidence for tree nuts and sesame
17 seeds is limited.

18 Limited evidence also suggests that
19 there is no relationship between consumption of
20 peanut, tree nuts or sesame seeds during the
21 complementary feeding period and the risk of atopic
22 dermatitis or eczema and asthma.

1 And there is not enough evidence to
2 determine if there is a relationship between
3 consuming peanut, tree nuts or seeds and allergic
4 rhinitis.

5 What I want to also mention is that many
6 of the studies included in this review exclusively
7 enrolled or primarily enrolled subjects who were
8 at a greater risk of allergies and/or atopic
9 disease than the general population on the basis
10 of family history.

11 However, despite this, the reviewers
12 concluded that the results are probably
13 generalizable to infants and toddlers who are at
14 lower risk for atopic disease, although the
15 magnitude of the associations may be smaller.

16 There were 28 studies that examined the
17 consumption of eggs as a complementary food in
18 relationship to the risk of developing any atopic
19 disease, including six randomized controlled
20 trials.

21 From that body of evidence, it was
22 concluded that moderate evidence suggests that

1 introducing egg in the first year of life, after
2 four months of age, may reduce the risk of food
3 allergy to egg.

4 Limited evidence suggests that there is
5 no relationship between the age of introduction to
6 egg and the risk of atopic dermatitis or eczema and
7 asthma, and there's not enough evidence to
8 determine the relationship between egg and
9 allergic rhinitis.

10 For fish, 24 studies examined fish as
11 a complementary food, including one randomized
12 controlled trial. From this body of evidence,
13 there is limited evidence that suggests that
14 introducing fish in the first year of life after
15 four months of age may reduce the risk of atopic
16 dermatitis and eczema, and there is not enough
17 evidence to determine this relationship to the risk
18 of allergy to fish or other foods, asthma or
19 allergic rhinitis, and also not enough evidence for
20 the relationship to the risk of food allergy,
21 atopic dermatitis, eczema, asthma or allergic
22 rhinitis.

1 There were 17 studies that examined the
2 consumption of wheat or cereals and these outcomes,
3 and all of these were observational studies. So
4 limited evidence suggests that there is no
5 relationship between the age of introduction or
6 cow's milk products such as cheese and yogurt and
7 the risk of food allergy and atopic dermatitis and
8 eczema.

9 There's not enough evidence to
10 determine if there's a relationship between
11 consuming milk products during the complementary
12 feeding period and the risk of asthma or allergic
13 rhinitis.

14 Did I skip something? I'm going to go
15 back a second. Here we go. Sorry. There are a lot
16 of outcomes here. So sorry. I'm going to go back
17 to wheat and soy. And I did mention there were 17
18 studies that examined the consumption of wheat or
19 cereals, and these were all observational, and
20 there's not enough evidence for those related to
21 wheat to determine the relationship to risk of food
22 allergy, atopic dermatitis and eczema, asthma or

1 allergic rhinitis.

2 For soy, there were four prospective
3 studies that examined this relationship and that
4 indicated that there was not enough evidence to
5 determine if there was a relationship between
6 soybean consumption and the risk of any of these
7 outcomes. Okay, I think I will move on.

8 There were several observational
9 studies that also examined the relationship
10 between other types of complementary foods and
11 beverages that are generally not considered to be
12 major allergens; for example, fruit, vegetables,
13 and meats, and this conclusion was that there was
14 limited evidence from observational studies that
15 suggest that introducing foods not commonly
16 considered to be allergens in the first year of life
17 after four months of age is not associated with risk
18 of food allergy, atopic dermatitis or eczema,
19 asthma or allergic rhinitis.

20 There were also several observational
21 studies that examined dietary diversity or dietary
22 patterns, and these were 11 prospective cohort

1 studies and three case control studies, but there
2 was not enough evidence to determine a relationship
3 between these aspects of the diet and any of these
4 outcomes.

5 Okay. Moving on to the next set of
6 outcomes, which is growth, size, and body
7 composition, there were 81 studies that met the
8 inclusion criteria for the timing of introduction
9 of complementary foods and beverages, and 49 that
10 met the criteria for types and amounts.

11 So in terms of timing of introduction,
12 moderate evidence suggests that the first
13 introduction of any complementary food or beverage
14 between four to five months, compared to
15 approximately six months of age, is not associated
16 with weight status, body composition, body
17 circumferences, weight, or length, among generally
18 healthy, full-term infants.

19 Limited evidence suggests that
20 introducing complementary foods and beverages
21 before four months of age may be associated with
22 higher odds of overweight and obesity. And

1 there's not enough evidence to determine the
2 relationship between introduction of
3 complementary foods and beverages at seven months
4 or later on growth, size, and body composition.

5 In terms of types and amounts of
6 complementary foods, moderate evidence indicates
7 that a higher versus lower meat intake or meat
8 versus iron-fortified cereal intake over a shorter
9 duration during the complementary feeding period,
10 does not favorably or unfavorably influence
11 growth, size and/or body composition.

12 And there's insufficient evidence to
13 determine the relationship between meat intake and
14 prevalence or incidence of overweight or obesity.
15 Limited evidence suggests that the type or amount
16 of cereal given does not favorably or unfavorably
17 affect these outcomes.

18 In terms of fatty acids, moderate
19 evidence suggests that consumption of
20 complementary foods with different fats and/or
21 fatty acids composition does not favorably or
22 unfavorably influence growth, size, or body

1 composition.

2 And there's not enough evidence to
3 determine the relationship to the prevalence or
4 incidence of overweight or obesity. Limited
5 evidence suggests that sugar-sweetened beverage
6 consumption during the complementary feeding
7 period is associated with decreased risk of obesity
8 in childhood, but it is not associated with other
9 measures of growth, size, and body composition.

10 There is limited evidence that showed
11 a positive association between juice intake and
12 infant weight-for-length and child BMI z-scores.

13 No conclusion could be made about the
14 relationship about other complementary foods as
15 listed here and growth, size, body composition, or
16 overweight or obesity.

17 And also no conclusion could be made
18 about the relationship between distinct dietary
19 patterns during the complementary feeding period
20 and growth, size, body composition, or these other
21 outcomes.

22 There was a much smaller body of

1 evidence regarding developmental outcomes. For
2 the timing of introduction of complementary foods
3 and beverages, only three studies met the criteria,
4 and for types and amounts, only eight studies met
5 those criteria.

6 So not surprisingly, given that small
7 evidence base, there was insufficient evidence to
8 draw conclusions about the relationship between
9 the timing of the introduction of complementary
10 foods and beverages and developmental milestones.

11 One of the issues with this body of
12 evidence is that there is the potential for reverse
13 causation. In other words, the child might be more
14 developed and therefore be more demanding of
15 introduction of other foods and beverages. And so
16 with observational studies, it's very difficult to
17 study this relationship.

18 There was also insufficient evidence to
19 draw a conclusion about the relationships between
20 the types and amounts of complementary foods and
21 beverages consumed and developmental milestones.

22 There was also a very small evidence

1 base in terms of bone health. Three studies met
2 the criteria for timing of introduction of
3 complementary foods and beverages, and eight met
4 the criteria for types and amounts.

5 So again, not surprisingly, the
6 conclusion was that there was insufficient
7 evidence to draw conclusions about the
8 relationship of timing of introduction of
9 complementary foods and beverages and bone health.

10 And similarly, insufficient evidence
11 was available between the types and amounts of
12 complementary foods and beverages and bone health.

13 Okay. So those are the 66 conclusion
14 statements we had to get through today, and now I'm
15 going to present some of the discussions that we've
16 had related to refining and prioritizing the
17 remaining work in front of us.

18 So as I mentioned, we have two questions
19 regarding human milk and infant formula and outcome
20 domains, including growth, size, and body
21 composition. So for this one, it's a very, very
22 large literature, and for this purpose, we've

1 decided to examine outcomes related to body
2 composition only, which includes obesity and
3 overweight.

4 Our rationale for this is that we
5 already know that growth curves differ between
6 infants fed human milk and those fed infant
7 formula. In fact, the U.S. Government convened an
8 expert panel several years ago to review such
9 evidence, and as a result, the CDC adopted the World
10 Health Organization growth curves from birth to age
11 two years, which reflect the growth of breastfed
12 children.

13 On the other hand, the relationship
14 between human milk or infant formula consumption
15 and body composition outcomes, including obesity,
16 warrants further examination, and for that reason,
17 we have altered the protocol for this, which is
18 going to be available on DietaryGuidelines.gov.

19 We also discussed the remaining
20 questions that examine intake of nutrients from
21 supplements and fortified foods, and for this, we
22 decided to prioritize for the first question

1 related to growth, size and body composition, to
2 focus only on iron and iron from supplements.

3 For the second one related to bone
4 health, we decided to focus only on vitamin D and,
5 again, only from supplements. And for the third
6 question related to nutrient status, we decided to
7 focus on iron and vitamin D from supplements only.

8 Our rationale for limiting these
9 reviews to the nutrients from supplements is that
10 the existing reviews from the previous project,
11 which I just reviewed with you today, examined
12 complementary foods and beverages and included
13 fortified foods.

14 So we feel that the real need for new
15 work here is on these nutrients from supplements.

16 Our rationale for examining iron and vitamin D only
17 is that we would like to review evidence about
18 nutrient supplements that are currently
19 recommended for this age group.

20 So that is where we will be moving
21 forward as we continue the work. So our next steps
22 are summarized here. There will be a literature

1 search on iron and vitamin D from supplements and
2 nutrient status.

3 There will be screening of the
4 literature also for iron and vitamin D from
5 supplements. Oh, that will include a screening of
6 the literature, as well as vitamin D from
7 supplements and bone health.

8 We will then have to extract the data,
9 assess risk of bias, and develop conclusions and
10 grades for the five questions that are listed here.
11 And again, those are human milk and infant formula
12 consumption, growth, size and body composition,
13 and developmental outcomes, and then the specific
14 nutrients from supplements and the three outcome
15 areas that I mentioned.

16 And then lastly, we will be
17 drafting -- going through the peer-review process
18 and drafting the report. And with that, I would
19 like to again thank the members of the subcommittee
20 very much, thank and acknowledge the very hard and
21 extensive work by our support staff, who are listed
22 on this slide.

1 Thank you very much.

2 (Applause.)

3 VICE CHAIR KLEINMAN: Thank you, Kay,
4 for an incredibly complete summary of the work of
5 the subcommittee. So we've already had some
6 cross-cutting conversations between a few of the
7 subcommittees, but this is our opportunity now as
8 a full Committee to ask any further questions or
9 to comment on what Kay has presented.

10 So I'll open it up to the Committee now
11 for questions. Rick. And don't forget to say your
12 name.

13 MEMBER MATTES: Rick Mattes. So I
14 have five questions, but a lot of them will be
15 really short, I think, responses. The first is, you
16 used the term "intensity" of feeding. I'm just not
17 clear on what intensity means, so a clarification,
18 that would be helpful.

19 Your recommendation regarding fat
20 intake and fatty acid status just referred to
21 association, whereas all the other recommendations
22 had directionality to them.

1 If it's possible to tweak that, I think
2 it would be more useful. If it's not, it's not.

3 In the report on never versus ever and
4 risk of type 1 diabetes, you found an association
5 there; this is my lack of knowledge, is there a
6 plausibility? Is there a mechanism that would make
7 that make sense?

8 With the peanut
9 recommendation -- again I'm old school -- is there
10 some subset of people that may actually be at risk
11 so a general recommendation saying early
12 introduction is okay, holds risk for some subgroup
13 of the population, or it really is a clear bill of
14 health for such a recommendation?

15 MEMBER DEWEY: Can you repeat that
16 again?

17 MEMBER MATTES: So the recommendation
18 for early exposure to peanut seemed to be just
19 generally positive, and I'm just wondering if there
20 is a subgroup of individuals that might be at risk?
21 Because if people just look at that recommendation,
22 they'd think that it's good to go, but maybe there

1 are some that would be at risk. I don't know.

2 And lastly, for the sugar
3 recommendation, it says that sugar-sweetened
4 beverage consumption during complementary feeding
5 is associated with increase of obesity, but not
6 associated with body composition. I'm just not
7 clear how to juxtapose those.

8 MEMBER DEWEY: So those are very good
9 questions, and I'm going to rely on others in the
10 room to help with some of the answers.

11 For the intensity of breastfeeding,
12 this is part of three different aspects of when
13 children are fed both infant formula and human
14 milk.

15 It relates to how many of the feeds are
16 human milk versus formula or the amounts, or in some
17 other way judging the proportion. So the
18 intensity refers to how much of that is human milk.

19 It's a guesstimate, in most cases,
20 because they're not measuring human milk intake.
21 So that's why different words are used by different
22 researchers.

1 Is there any -- if anybody wants to add
2 anything from the staff who knows these definitions
3 by heart?

4 Yes, please, Darcy.

5 MS. GUNGOR: Just one clarification,
6 which is that intensity, proportionate amount, be
7 included in any evidence that was examined, either
8 at a single point in time or over a duration of time,
9 and that might have included another variable in
10 the definition such as months or years, that sort
11 of thing.

12 MEMBER MATTES: So in any write-up,
13 that will be defined somewhere?

14 MEMBER DEWEY: In the paper that was
15 published, that is given, yes.

16 And then in terms of fat composition of
17 complementary foods, and that we said there is an
18 association without the direction, and that was on
19 purpose, because it really depends on what fatty
20 acids are in those foods.

21 So if there is an increased amount of
22 polyunsaturated fatty acids, for example, that

1 will generally show up in the fatty acid status as
2 a positive relationship in the child. But it's not
3 simple to summarize that in the conclusion
4 statement.

5 So in the paper that was published, it
6 goes through exactly what all those relationships
7 were. We can talk further about whether there is
8 some way to modify that, but for that question,
9 we're relying on the existing review that's been
10 published already, and that's their exact wording.

11 MEMBER MATTES: So it is possible for
12 it to be inverse in some instances, or could it just
13 be stated as a direct relationship?

14 MEMBER DEWEY: Well, I would have to
15 read again exactly which studies that -- there's
16 always theoretically the possibility that if you
17 increase intake of omega-6, you might reduce
18 omega-3 status, or vice -- I mean, so -- and that's
19 why I don't want to get too specific about it right
20 now.

21 MEMBER DONOVAN: Yeah. And I think in
22 some the ever versus never types of questions,

1 because the composition of breast milk fatty acids
2 differ from formula, because the breastfeeding
3 moms' maternal diet, and formulas are added oil,
4 so I think in some cases they're higher, and in some
5 cases, they're lower.

6 So rather than have a conclusion
7 statement that was three paragraphs long to go
8 through each of them, it was basically a general
9 statement of there is associations between dietary
10 intake and the outcome.

11 MEMBER DEWEY: So I thought you were
12 referring to fatty acids from complementary foods
13 and beverages, but we've been also referring to the
14 never versus ever human milk and those questions?

15 MEMBER MATTES: I'm not sure where my
16 brain kicked off as you were going through, but for
17 either of them, I'm --

18 MEMBER DEWEY: Okay. So there were
19 two different questions where fatty acid status was
20 an outcome. One was from complementary foods and
21 beverages. That's what I was answering.

22 For human milk, ever versus never,

1 duration et cetera, we also shied away, as Sharon
2 explained, from stating a direction, because
3 it's -- as we were talking yesterday in our
4 subcommittee meeting, it's complicated, because of
5 the composition of human milk and the possibility
6 that the mammary gland has endogenous synthesis of
7 many of these fatty acids. And so it's
8 something that we will describe in more detail in
9 the write-up.

10 And then you asked about never versus
11 ever breastfeeding in type 1 diabetes and the
12 plausibility of that argument.

13 Yes, there is a biological rationale
14 for that. I'm not sure I'm ready to explain it
15 thoroughly here, but it relates to the components
16 that are in human milk and their relationship to
17 development of physiological function, immune
18 status and reaction to antigens.

19 If anyone else wants to go further than
20 that, be my guest.

21 VICE CHAIR KLEINMAN: That's an
22 absolutely fair summary. But one of the things

1 that I think is a little bit confusing is the
2 absence of any relationship to prediabetes, yeah
3 type 2.

4 You'd expect that those same markers
5 would be present in type 1 in advance of that
6 disease expressing itself. So we might want to pay
7 a little bit more attention to that, as we put this
8 together, because you'd expect insulin resistance,
9 glucose intolerance, A1Cs.

10 They don't -- you know, they rise
11 gradually both in type 1 and in type 2.

12 MEMBER DEWEY: Uh-huh.

13 VICE CHAIR KLEINMAN: Just a point
14 of -- for further discussion in the statement.

15 MEMBER DEWEY: That's a great idea. I
16 think we will take that up.

17 And then your fourth question was
18 regarding peanut exposure in the first year of
19 life, and I think the question was, are there
20 infants who are risk from that exposure because
21 they are at high risk to begin with?

22 Now, I am, again, going to defer, I

1 think, to the clinicians, but my understanding is
2 that those with a family history are usually
3 advised to be under the sort of supervision of the
4 health care provider when they first introduce that
5 allergen, to be careful about that.

6 So do you want to go further than that?

7 VICE CHAIR KLEINMAN: No. I think
8 that's absolutely right, and the studies use
9 test -- use individuals, infants, who have strong
10 family history, so these are the highest-risk
11 infants. So presumably, if they pass this test,
12 everyone else who is at lesser risk isn't going to
13 be put at greater risk as a result of the
14 introduction.

15 So that -- is that your question?

16 MEMBER MATTES: Yeah, yeah, that's --

17 VICE CHAIR KLEINMAN: Yeah.

18 MEMBER MATTES: -- exactly my
19 question. So the follow-up is does the
20 recommendation need to have that caveat in it, or
21 does that group of high-risk people sort of fall
22 out of the definition of the healthy population

1 that we're making recommendations for, and so it's
2 not necessary?

3 MEMBER DEWEY: Well, I'd like to say
4 we're not yet at the point of making dietary
5 recommendations. Right now we're only drafting
6 conclusion statements from the evidence. How to
7 put all this together into a recommendation is the
8 next challenge.

9 Yeah. There was one more question from
10 Rick --

11 VICE CHAIR KLEINMAN: Uh-huh?

12 MEMBER DEWEY: -- and that had to do
13 with sugar-sweetened beverages and why were those
14 related to overweight or obesity and not to the
15 continuous markers of body size or composition?

16 I think that the strongest evidence we
17 have is from one very large study where the outcomes
18 were dichotomous only, and so that's why we felt
19 comfortable saying that. We didn't have the same
20 amount or strength of evidence for the direct
21 continuous measures of weight for height or BMI or
22 anything like that.

1 That's my recollection. I'd have to go
2 back to that paper and look at it again, but that
3 was what I remember. Any additions to that?

4 MEMBER MAYER-DAVIS: So is this on?
5 They'll pick it up. Just start talking. I can start
6 talking. Okay. So back to the -- so this is Beth
7 Mayer-Davis. So, Kay, I have a question to follow
8 up to Rick's about type 1 diabetes. It's not
9 specified in the question itself, but I wonder if,
10 in your look at infant feeding with regard to type 1
11 diabetes, you were looking also as the occurrence
12 or appearance of diabetes autoimmunity?

13 MEMBER DEWEY: What was that?

14 MEMBER MAYER-DAVIS: The appearance of
15 diabetes autoimmunity, markers of diabetes
16 auto-antibodies, as a prelude to development of
17 Type 1 diabetes, because that's where some of the
18 mechanism comes in, in answer to your question,
19 Rick. And there is some literature on that.

20 MEMBER DEWEY: Oh. Darcy is quicker
21 than me. I'm looking here.

22 You're shaking your head, so those

1 markers were not --

2 MS. GUNGOR: No.

3 MEMBER DEWEY: Okay. So it was only
4 the other ones that we defined. Yeah. And again,
5 that was just done by the Complementary Feeding
6 TEC, and all of those definitions of outcomes are
7 in those published papers.

8 MEMBER SABATÉ: Yes. Joan Sabaté.
9 Regarding the timing and regarding the types of
10 foods and the outcomes that you have examined,
11 basically anthropometrics, biological measures of
12 fatty acids and minerals so on and so forth, and
13 also allergy, what was the outcome measured of
14 these studies?

15 I mean, within the 24 months, including
16 to the childhood, in adolescence or in adulthood,
17 or all this above?

18 MEMBER DEWEY: The age of outcome
19 assessment, if I'm correct, varied, depending on
20 the outcome domain. So if I remember correctly,
21 micronutrient status was generally the more short
22 term within the first two years of life.

1 I'm looking at Julie. She remembers.
2 Growth, size and body composition went up to -- was
3 it 18 or adulthood? Development went, I think, as
4 far as -- was available -- atopic and allergic
5 disease went all the way to adulthood?

6 Is that right?

7 DR. OBBAGY: Yes.

8 MEMBER DEWEY: Up to 18. And bone
9 health?

10 DR. OBBAGY: Eighteen.

11 MEMBER DEWEY: So most of them went
12 pretty long term. But the evidence base or may not
13 have been very strong out of those longer-term time
14 points.

15 VICE CHAIR KLEINMAN: Are there other
16 questions?

17 CHAIR SCHNEEMAN: So given the number
18 of conclusion statements where you've had, let's
19 say, insufficient evidence or no evidence, I'm
20 interested to know, is the subcommittee working on
21 the research agenda and particularly prioritizing
22 some of the most critical needs as far as this

1 research?

2 MEMBER DEWEY: Yeah. We are trying to
3 keep track of research recommendations as we go.
4 From the previous reviews that have been published,
5 they also did a good job of summarizing the research
6 needs. So that's kind of already there.

7 It's going to be a huge list, as you can
8 imagine. So prioritizing them is something that
9 I feel we need to discuss. In the context of
10 dietary guidelines, it might revolve around not
11 necessarily one of the most interesting questions
12 but which ones might have the biggest influence on
13 what we advise people to do.

14 So if there's already compelling
15 evidence from outcomes X, Y and Z for, let's say,
16 breastfeeding, well, do we need to go further
17 than -- and find outcomes -- you know, other
18 outcomes to add to that or not?

19 Whereas for some of the other dietary
20 recommendations for this age group, there's almost
21 nothing, and in those cases, we may not know what
22 to say at all, and so in that case, it might be a

1 higher priority.

2 So I'm just thinking out loud,
3 actually, about would you prioritize in this
4 particular situation.

5 VICE CHAIR KLEINMAN: All right. So I
6 think adults need to have a little break, and we've
7 been going for over an hour and a half, so we're
8 going to take exactly 10 minutes. Get up and
9 stretch or do whatever else you need to do.

10 And then we'll return and hear from
11 Sharon Donovan and the Pregnancy and Lactation
12 Subcommittee report.

13 Thank you. So 10:48.

14 (A short recess was taken.)

15 DR. STODY: Thank you. Thanks for
16 joining us again after the break. I do want to just
17 make a quick announcement. We are in a multistory
18 building, and sometimes fire alarms do happen, so
19 if you hear one, please hold tight. We are told
20 if we are asked to evacuate, we'll hear an
21 announcement.

22 Sometimes they just evacuate the floor

1 that's involved and the floor above and below, so
2 if that is to happen, we'll hear an announcement,
3 and the exit is just right there at the top of the
4 stairs.

5 And thank y'all. I know several
6 have -- that is the preferred kind of in-and-out
7 for the meeting, if you can help that happen, just
8 to help kind of minimize some of the distraction
9 here at the front of the room.

10 So just a quick announcement, and I'll
11 turn it back over to the Committee.

12 VICE CHAIR KLEINMAN: Thank you very
13 much, Eve. I'm going to turn it over now to Sharon
14 Donovan, and she's going to summarize the work of
15 the Pregnancy and Lactation Subcommittee.

16 MEMBER DONOVAN: Okay. My
17 microphone's on. So my name is Sharon Donovan, and
18 it's my pleasure to present on behalf of the
19 Pregnancy and Lactation subcommittee. If I can
20 have the slides, please.

21 VICE CHAIR KLEINMAN: We need to have
22 the slides brought up, please.

1 MEMBER DONOVAN: So I'll go ahead and
2 start talking while that's coming. So this shows
3 the subcommittee members, and I'd like to thank
4 them all for all of their hard work, on our weekly
5 call, and on the work between the calls.

6 So my goal today will be to discuss the
7 evidence synthesis creating a conclusion for eight
8 reviews. But before we get started, I wanted to
9 just provide just kind of an overview to remind
10 people of the questions that were assigned to our
11 subcommittee.

12 So there were three major categories.
13 One -- the first was nutrients and supplements in
14 fortified foods, and this could be consumed before
15 and during pregnancy and lactation.

16 So we looked at up to six months prior
17 to conception, and during pregnancy and/or
18 lactation. We are examining six nutrients, so
19 B-12, folate, iron, iodine, vitamin D, and
20 omega-3s -- they should sound fairly familiar from
21 Kay's presentation -- and five outcomes, so human
22 milk composition, gestational diabetes,

1 hypertensive disorders of pregnancy,
2 neurocognitive development of the infant, and
3 micronutrient status of the mother.

4 So that was our first set of questions.
5 The second relates to dietary patterns during
6 pregnancy and with five outcomes. I'm not going
7 to read all of those, but you can see these are
8 related to the maternal dietary patterns during
9 pregnancy, and three outcomes during lactation, so
10 milk composition, infant neurocognitive
11 development, and postpartum weight loss.

12 We also had a third area, which was
13 maternal diet and food allergies and atopic
14 diseases in the infant. So as noted, the NESR
15 staff has been working very diligently, and thus
16 far has screened 21,500 articles and extracted the
17 data and assessed risk of bias from 42. And
18 obviously, additional searches and extraction are
19 underway.

20 So again, just -- within each of these
21 three areas, just to briefly remind you of where
22 we are in the process:

1 So for folate, we have addressed all
2 five questions. And so the effect of maternal
3 folate from supplements or fortified foods on human
4 milk composition and gestational diabetes was
5 presented in meeting three, and that information
6 is available on the Dietary Guidelines.gov.

7 Today, I will be presenting on maternal
8 folate from supplements and fortified foods on
9 hypertensive disorders of pregnancy,
10 neurocognitive development of the infant, and
11 micronutrient status of the mother.

12 As noted, our committee is currently in
13 the process of refining and prioritizing the
14 additional searches for these -- the rest of the
15 nutrients and these outcomes. So you can just do
16 the math to see this would have been quite a number
17 of systematic reviews to address all of these.

18 So in terms of dietary patterns, today
19 I'll be presenting a new systematic review on the
20 impact of dietary patterns on human milk
21 composition, and as with the B-24 Project, there
22 were four previous NESR systematic reviews that

1 were developed as part of the Pregnancy and Birth
2 to 24 Project.

3 So we examined those, as Kay described.
4 We looked at the -- we ran through each of the
5 statements. We also looked at any papers that have
6 been published since January 2017, which was the
7 end of the these reviews, to see whether any primary
8 research -- and we also looked at existing
9 systematic reviews published since that time to see
10 whether they caught any papers, mainly with an eye
11 to has there anything really been published in the
12 last two years that would impact the conclusions
13 made in those systematic reviews?

14 And as with B-24, we decided to accept
15 those existing reviews, NESR reviews, and so I'll
16 review those outcomes. Currently, we're looking
17 at the dietary patterns on gestational weight gain,
18 postpartum weight loss, micronutrient status, and
19 infant neurocognitive development, and the plan is
20 to present those at meeting five. Also underway
21 is the question on maternal diet and food allergies
22 and atopic diseases, which will also be presented

1 in March.

2 So jumping into our first folic acid
3 questions, what is the relationship between folic
4 acid supplements and/or fortified foods consumed
5 before and during pregnancy on the risk of
6 hypertensive disorders?

7 So just as a reminder, the definitions
8 that we've used for dietary supplements, basically
9 from the Dietary Supplement and Health Education
10 Act, so products other than tobacco that is
11 intended to supplement the diet. And
12 fortification, again, the FDA definition -- the
13 deliberate addition of one or more essential
14 nutrients.

15 So briefly, you've seen the layout for
16 the analytical framework. So in terms of folic
17 acid, our interventions and exposures were
18 exposure to and including intake of folic acid from
19 supplements, fortified foods or the combination,
20 and the comparators were a different level of
21 exposure, including no exposure from supplements,
22 fortified foods, or a combination.

1 In this case, the population was the
2 women before and during pregnancy, either healthy
3 or at risk for chronic diseases, and in this case,
4 hypertensive disorders of pregnancy.

5 We had intermediate outcomes that we
6 examined, including blood pressure and
7 proteinuria, and then we have the longer-term
8 outcomes of eclampsia, preeclampsia, and
9 gestational hypertension.

10 Summarized at the bottom are the key
11 confounders, and most of those are ones that we're
12 including in all of our systematic reviews. We
13 also have other factors to continue -- or consider
14 for the hypertension -- hypertensive disorders,
15 which include physical activity and substance
16 abuse and gestational age.

17 So this search was done in
18 combination -- oh, I'm sorry. This one. This
19 search was -- actually, it was. I'm sorry. So
20 this was done in combination with the search for
21 folic acid and hypertension and gestational
22 diabetes, and as I mentioned, gestational diabetes

1 was presented at the last meeting.

2 So we screened 622 articles and we
3 included eight related to hypertension, and you can
4 see on the right that the included articles were
5 three RCTs, two non-randomized controlled trials,
6 and three prospective cohorts.

7 And all of them directly asked the
8 question of the relationship between folic acid
9 supplements consumed during -- before and during
10 pregnancy -- and we basically will present later,
11 but we did not find evidence on fortified foods --
12 in folate in fortified foods.

13 So describing first the three RCTs, the
14 sample characteristics between 123 and 450, all of
15 these RCTs were conducted in Iran, and two were from
16 the same study. The interventions -- so again,
17 they were 25 in a normal pre-pregnancy BMI. The
18 race and ethnicity and SES were not reported, but
19 again they were all conducted in the same country.

20 The interventions varied by dose, so
21 .5, 1, or five milligrams of folic acid, and they
22 were all initiated in the first trimester and

1 continued through delivery. All reported
2 preeclampsia and blood pressure, and some reported
3 other outcomes, proteinuria, eclampsia,
4 gestational hypertension.

5 So the two non-randomized controlled
6 trials, one was conducted in Italy and one in China,
7 range from 146 to nearly 5,000 subjects.
8 Again, Caucasian, and race and ethnicity in China
9 was not directly reported, nor was SES.

10 The group in Italy had pre -- this was
11 in a higher-risk group, so these were women who had
12 preeclampsia in a previous pregnancy, and so this
13 will factor into some of our conclusions.

14 So this was the one thing that you can
15 imagine, with these different studies, they have
16 different levels of exposure, and also in this
17 study, they had 5-methyltetrahydrofolate as a
18 supplement, and they ranged in initiation, but they
19 all went through delivery.

20 And then the three prospective cohort
21 studies, you can see the n's. These were in
22 Australia, Canada, and Denmark. The women were

1 between 20 and 30 years of age, and you can see the
2 race and ethnicity. They range from low to high
3 SES within these countries.

4 So in these, they actually compared no
5 supplement with a folate or folic acid alone. And
6 they had initiation and duration of various times,
7 so you know, by trying to look at the evidence we're
8 taking into account when the timing of the
9 initiation and the duration was, and the primary
10 outcome was preeclampsia.

11 So the summary of the evidence. So
12 none of the RCTs found an association between folic
13 acid supplementation and the incidence of
14 hypertensive disorders of pregnancy, including
15 gestational hypertension, preeclampsia, or
16 eclampsia, and none of the studies compared folic
17 acid supplementation to a control group that had
18 no supplementation. So in these studies, the
19 control did have a low level -- lower level of
20 exposure.

21 In contrast, when we looked at the
22 non-randomized controlled trials, both found a

1 significant association between folic acid
2 supplementation from early pregnancy through
3 delivery and reduced risk of preeclampsia and
4 gestational hypertension, compared to controls
5 with no folic acid supplementation.

6 And you can see, for preeclampsia,
7 significant reduction, both in this case -- both
8 for high risk and low risk, and for gestational
9 hypertension, again, a significant reduction.

10 And one non-controlled RCT was among high-risk
11 population of women who had previously been
12 diagnosed with preeclampsia.

13 So when we looked at the three
14 prospective cohort studies, the results were
15 mixed. One found an association with folic acid
16 in the first trimester and lower incidence of
17 preeclampsia, but specifically for women with a
18 higher BMI.

19 Another found an
20 association -- significant association between
21 folic acid use between 12 and 20 weeks of gestation
22 and preeclampsia, again, in women at high risk, and

1 a third found no association.

2 So our draft conclusion statement is
3 that limited evidence suggests that folic acid
4 supplementation during early pregnancy may have a
5 beneficial effect on reducing the risk of
6 hypertensive disorders during pregnancy among
7 women at high risk, either having a history of
8 preeclampsia or a higher pre-pregnancy BMI,
9 compared to no folic acid supplementation.

10 This conclusion was supported by
11 three -- or two non-randomized controlled and the
12 three prospective cohorts. The studies were all
13 direct in terms of the question, and they were
14 consistent for the higher-risk women.

15 And as with all of the studies, there
16 were some concerns about risk of bias, precision,
17 and generalizability, particularly for some of the
18 studies that were not done in the U.S.

19 So there was moderate evidence
20 suggesting that higher levels of folic acid
21 supplementation during pregnancy, compared to
22 lower levels, including no folic acid, does not

1 affect the risk of hypertensive disorders during
2 pregnancy among women at low risk. So we had a
3 separate conclusion for women at high versus low
4 risk.

5 And there's no evidence available to
6 draw a conclusion about the relationship between
7 folic acid from fortified foods before and during
8 pregnancy and the risk of hypertensive disorders
9 during pregnancy.

10 So turning now to the relationship
11 between folic acid supplements and/or fortified
12 foods consumed by the mother before and during
13 pregnancy and developmental milestones, including
14 neurocognitive development of the infants. This
15 is another new systematic review.

16 So the analytical framework,
17 intervention/exposure were the same in terms of the
18 outcomes. In this case, the population for the
19 outcome is the infant.

20 So we had infants and toddlers, birth
21 to 24 months, but we also incorporated children and
22 adolescents from two to 18 for some of the

1 developmental outcomes, and you can see these are
2 listed, because not all of the evidence is
3 available in early childhood.

4 So for example, we were looking at
5 academic performance, also attention deficit
6 disorder, ADHD, anxiety, depression, and autism.
7 So in addition to some of the developmental
8 milestones, we needed to extend the search
9 criteria.

10 So with key confounders, some of the
11 aspects that we added to this one were child sex,
12 breastfeeding practices, intensity and duration,
13 and you can see in other factors to be considered,
14 we also looked at -- took into account, a family
15 history of a diagnosis of a neurocognitive
16 disorder.

17 So we had a total of 1,831 articles that
18 were screened, and six were included. There were
19 actually four studies that produced the six
20 articles. Two RCTs that have three articles.
21 One prospective cohort published in two articles,
22 and one nested case-control. And they all

1 addressed the question of again, folic acid
2 supplements consumed during pregnancy on the
3 neurocognitive outcomes.

4 So the sample characteristics are
5 shown, range of 39 to 130, 17 to 37 children, that
6 were conducted in the U.K., Germany, and then a
7 study that incorporated participants from three
8 countries in Europe.

9 You can see the mothers were 20 to 31,
10 mostly white and higher SES, and the outcomes of
11 children for -- were older, so the children in
12 these studies were between six and a half and eight
13 and a half.

14 The interventions, again, varied by
15 dose. They also had an intervention with or
16 without fish oil. The initiation was at 14 or 20
17 weeks gestation and through delivery. And again,
18 the outcomes are shown below, but we'll go through
19 those.

20 So the one prospective cohort was done
21 in Norway. This was a very large study. Again,
22 the maternal age and high SES, and in this case,

1 the children were assessed at three years of age.

2 The dose basically was determined from
3 a questionnaire of folic acid supplementation.

4 And they looked at kind of two different phases.

5 So they looked at early, which could be four weeks
6 before conception to eight weeks of gestation, and
7 then those mothers who are supplemented, who
8 reported the folate between nine and 29 weeks of
9 gestation. So we're looking at the two different,
10 early and late.

11 So the outcomes were language
12 competence and then language delay. The nested
13 case-control was a study from Israel which, in this
14 case, 60 percent were low SES.

15 They assessed the children between six
16 and 12. The major outcome was AS -- autism
17 spectrum disorder diagnosis, and in this case, the
18 folic acid exposure was assessed by pharmaceutical
19 prescriptions.

20 So they basically were able to look at
21 the women who were prescribed folic acid or not,
22 and they looked before and during pregnancy and the

1 duration assessed before and during pregnancy or
2 birth.

3 So the summary of the evidence that
4 generally folic acid supplementation before or
5 during pregnancy was either not associated with or
6 had a beneficial association with the following
7 outcomes:

8 So language development. Two articles
9 from the prospective cohort study showed a lower
10 risk of severe language delay in three-year-olds
11 whose mothers consumed folic acid supplements
12 during early pregnancy.

13 For ASD, the one nested case-control
14 found a significant association between folic acid
15 supplementation before and during pregnancy and
16 lower ASD risk in eight-to-12-year-old children.

17 So for cognitive development, the
18 findings were inconsistent and no conclusions can
19 be drawn. For social-emotional development, we
20 included one study with concerns and no conclusion
21 could be drawn.

22 When we looked at movement or physical

1 development, academic performance, ADD or ADHD,
2 anxiety and depression, there was no evidence on
3 supplementation before or during pregnancy. And
4 developmental milestones and neurocognitive
5 development, there's no evidence on
6 supplementation during lactation and/or intake of
7 folic acid from fortified foods consumed before or
8 during pregnancy and lactation.

9 So the draft conclusion statement:

10 Limited evidence suggests folic acid
11 supplementation during early pregnancy may be
12 associated with lower risk of delayed language
13 development in the child.

14 So that, again, the conclusions were
15 based on two studies from one prospective cohort
16 study. The study -- they were direct in terms of
17 the question. We had some issues with
18 consistency, and there were some concerns, again,
19 regarding risk of bias, precision, and
20 generalizability, because it was one study, one
21 prospective cohort study.

22 There was limited evidence to suggest

1 that folic acid supplementation before and during
2 pregnancy may be associated with lower risk of
3 autism spectrum disorder in the child.

4 So again, this was based on the one
5 nested case-control study from Israel.
6 Consistency cannot be assigned, and there were some
7 concerns regarding risk of bias, precision, and
8 generalizability.

9 Insufficient evidence is available to
10 determine a relationship between folic acid from
11 supplements and fortified foods consumed before
12 and during pregnancy on cognitive development or
13 social-emotional development.

14 And there's no evidence on supplements
15 or fortified foods, folate, on movement or physical
16 development of the child, academic performance of
17 the child, and also the ADD or ADHD. So these are
18 supplements and/or fortified foods. And so for
19 these, these are grades not assignable.

20 There was also no evidence for the
21 relationship between folate supplements and
22 fortified foods performed during

1 lactation -- pregnancy and lactation on anxiety or
2 depression. So a grade is not assignable.

3 So basically this was looking at
4 lactation. So there was no evidence available to
5 look at supplements consumed during lactation on
6 development milestones, including neurobehavioral
7 development, and no evidence on fortified foods
8 consumed either during pregnancy or lactation.

9 So all the conclusions were based on
10 some folate from supplements before or during
11 pregnancy.

12 So the final folate question from a new
13 systematic review is looking at the relationship
14 between folic acid consumption and maternal
15 micronutrient status.

16 Again, similar framework, basically if
17 you look at the health outcomes, when we looked at
18 the folate status, we looked at: plasma blood
19 folate, B12, hemoglobin, mean corpuscular volume
20 and red cell -- red blood cell distribution width,
21 were the outcomes.

22 4,512 articles were screened, of which

1 there were four -- I'm sorry -- for the -- I'm
2 sorry -- 14 for micronutrient status, and of those
3 14, there were nine RCTs, three prospective
4 cohorts, one randomized cohort and one
5 uncontrolled before-and-after study.

6 All of the studies addressed directly
7 the question of supplements consumed before and
8 during pregnancy and lactation and micronutrient
9 status.

10 So to go through the nine RCTs, they
11 range from a very small study to a study of 189.
12 Three were conducted in Canada, two in the U.S.,
13 and one each in Iran, the U.K., Mexico, and France.
14 The women in most studies were between the ages of
15 26 and 34, mostly Caucasian and high SES, but one
16 study was in lower -- teenaged mothers with lower
17 SES. And in one study, it was conducted in 100
18 percent iron-deficient anemic women.

19 So the interventions varied across the
20 nine RCTs, ranging from 300 micrograms to five
21 milligrams of folic acid. And also, one study
22 looked at the methyltetrahydrofolate, and one

1 study looked at folinic acid.

2 The initiation varied from
3 pre-conception during pregnancy as well as
4 postpartum, and the duration was between one and
5 12 months. And most included serum plasma or red
6 blood cell folate, and other outcomes, common
7 outcomes, were B12, hemoglobin and mean
8 corpuscular volume.

9 So the three prospective
10 cohorts -- again, we're -- you can see the n,
11 conducted in Ireland, Germany and Canada, again,
12 29- to 30-year-old women, and within these
13 countries, race, ethnicity and SES were not
14 reported.

15 They looked at folic acid
16 supplementation via questionnaire versus none.
17 And there was various times of initiation and
18 duration of the study. So again, when we're
19 looking at the literature, we're trying to take
20 into account dose as well as the timing of exposure.
21 All of these reported plasma folate, and two
22 reported red blood cell folate, and one incidence

1 of folate deficiency.

2 The retrospective cohort -- Sorry. I
3 think I said that wrong before. The retrospective
4 cohort was conducted in Turkey. They compared
5 zero versus 400 micrograms per day of folic acid.
6 They initiated pre-conception, but the timing of
7 assessment varied by the participant. So they
8 all -- they didn't have a specific time point.

9 The outcomes, again, folate,
10 hemoglobin, and incidences of folic deficiency.

11 And there was a -- one uncontrolled
12 before-and-after study conducted -- a small study
13 conducted in Japan, and there was a limitation
14 of -- was -- that was not a lot in terms of the
15 participant characteristics, other than all from
16 the same SES.

17 So these were women that they gave a
18 supplement of one milligram per day of folic acid,
19 and then they were each -- sort of -- their own
20 control. They initiated this anywhere between
21 three and 25 weeks postpartum, and the duration was
22 four weeks.

1 So, all but one study found a
2 significant association between folic acid
3 supplementation and at least one outcome measure.
4 So, nine of 13 found positive association between
5 folic acid supplementation and plasma or serum
6 folate.

7 Nine of the 10 found positive
8 association between supplementation and red blood
9 cell folate. And two of five reported positive
10 association between folic acid supplementation and
11 hemoglobin. And there was no association found
12 between folic acid supplementation and these other
13 measures that we had included.

14 So, based on that, we've drafted a
15 conclusion that strong evidence suggests that
16 folic acid supplementation before and during
17 pregnancy is positively associated with folic acid
18 status using the outcomes of serum and plasma
19 and/or red blood cell folate.

20 The studies, again, were direct and
21 precise and consistent. Some concerns regarding
22 generalizability, but we felt that the evidence was

1 strong.

2 There was moderate evidence suggesting
3 that folic acid supplementation during lactation
4 is positively associated with red blood folate and
5 may be positively associated with serum and plasma
6 folate.

7 There was insufficient evidence
8 available to determine the relationship between
9 folic acid supplements before and during pregnancy
10 or during lactation on hemoglobin, MCV or B12, so
11 grade not assignable.

12 And no evidence to determine a
13 relationship with folic acid supplemented during
14 this time on red blood cell distribution width.
15 And again, there was no data, no evidence on folic
16 acid from fortified foods before and during
17 pregnancy and folate status.

18 So that's the summary of the three, and
19 our final three searches on folic acid. And so now
20 I'm going to turn to the question related to dietary
21 patterns. So, the first is a new NESR systematic
22 review on dietary patterns consumed during

1 lactation and human milk composition and quantity.

2 So again, a dietary pattern, as is being
3 defined and used by all of the subcommittees: so,
4 we're looking at quantities, proportions,
5 varieties, combinations, of the different foods.

6 So, to set up the analytical framework
7 for dietary patterns, the intervention and
8 exposure is consumption of and/or adherence to a
9 dietary pattern versus consumption or adherence to
10 a different dietary pattern or a different level
11 of consumption.

12 For example, we'll discuss studies that
13 have different fatty acids. So, the population
14 for milk composition, again, women during
15 lactation, healthy or at risk of chronic disease,
16 human milk quantity. These are exclusively or
17 predominantly breastfeeding women who are healthy
18 or at risk of chronic disease.

19 So we had a number of outcomes for human
20 milk composition. And these -- the milk samples
21 were all collected -- needed to be collected after
22 14 days postpartum, so we were looking at more

1 mature human milk, not colostrum.

2 So, we had macronutrients. We have
3 water-soluble vitamins including choline,
4 fat-soluble vitamins, iodine and selenium for the
5 minerals, human milk oligosaccharides, and any
6 bioactive -- of these bioactive proteins. And for
7 human milk quantity, it was assessed in milk
8 collected after 14 days.

9 So, the search, over 3,000 articles
10 were screened, of which seven were included in the
11 final summary. So, these were three RCTs that
12 produced four articles and two cross-sectional
13 studies.

14 And I just wanted to mention that, in
15 general, cross-sectional studies are not included,
16 or are excluded, but because oftentimes for human
17 milk composition, that's the only type of data
18 that's available -- there's a lot of RCTs or
19 prospective cohorts -- so we made a decision, and
20 this had been previously published and was open for
21 public comment. So that is just one difference
22 when we're looking at human milk.

1 So, all of them address the
2 relationship between maternal dietary pattern
3 during lactation and either human milk composition
4 or quantity. So, the three RCTs, again,
5 relatively small studies, seven to 15 mothers,
6 conducted in the U.S. and Canada, 29 years of age,
7 and SES and race and ethnicity not reported.

8 So, the initiation between six weeks
9 and six months postpartum. The durations were
10 four to 14 days. And they were reporting
11 different -- varied patterns. So carbohydrate,
12 either lower carbohydrate or higher fat versus
13 within the acceptable macronutrient distribution
14 range, or the AMDR. Another looked at higher fat,
15 and a higher carbohydrate and lower fat, and
16 another, higher fat versus consumption within the
17 AMDR.

18 So, you can see the various outcomes.
19 Most of the studies reported outcomes on fatty
20 acids, and one for B12.

21 So, for the cross-sectional studies,
22 these were conducted in the U.S. and Canada. They

1 were, on average, 30 -- nearly 30 -- I'm
2 sorry -- U.S. and China. The moms in the U.S. were
3 highly educated and in China, high-middle income,
4 and within the U.S., the race/ethnicity, reported
5 mostly white.

6 So, initiation, between 21 days
7 postpartum and six months, and nine and a half
8 months postpartum. So, these were ones that
9 looked more at the overall dietary patterns. So,
10 the study in the U.S. compared milk composition
11 with vegan, vegetarian, and non-vegetarian
12 mothers. And the study from China basically divided
13 the mothers into four different dietary patterns.
14 So, it's mushrooms, meat, seafood; soy, nuts,
15 dairy; fruits, vegetables; and then grains,
16 potato, beans and eggs.

17 So, summary of the evidence. So, one
18 cross-sectional study assessed the relationship
19 between maternal dietary patterns and total fat
20 levels in human milk and found no association.

21 Three RCTs assessed the relationship
22 between maternal diet based on macronutrient

1 proportions and total fat level in milk. Two found
2 a positive association -- positive relationship
3 between greater than 35 percent of energy from fat
4 and total fat in human milk, and one study found
5 no association between macronutrient proportions
6 and maternal diet and total fat.

7 So, the draft conclusion statements for
8 total fats is that insufficient evidence is
9 available to determine the relationship between
10 dietary patterns consumed during lactation and
11 total fat in milk, and there's limited evidence to
12 suggest that maternal consumptions of diets higher
13 in fat during lactation is related to higher total
14 fat, with a grade of Limited.

15 The studies were consistent, but there
16 were concerns about precision, generalizability,
17 and consistency, and we had a long conversation
18 yesterday, because these are also being used for
19 other outcomes that -- probably measuring fat in
20 human milk is one of the most difficult components,
21 because some studies were measuring during the fed
22 state versus the fasting state, and because the

1 content of milk differs from fore-milk to
2 hind-milk, so within a single feeding, if they're
3 just taking a single sample or not a full breast
4 expression or sampling over 24-hour periods, all
5 of these things can really affect the composition.
6 So that was, you know, some of the concerns that
7 we have about the precision.

8 So two cross-sectional studies and
9 three RCTs assessed the relationship between
10 maternal dietary patterns, including based on
11 macronutrient proportions and levels of saturated
12 fatty acids, MUFAs and PUFAs, and there were mixed
13 results.

14 So in terms of saturated fats, MUFAs and
15 PUFAs, there's limited evidence to suggest the
16 maternal dietary patterns during lactation,
17 including diets based on macronutrient
18 distributions, are related to the relative
19 portions of saturated fat, MUFAs and PUFAs.

20 And we meant to very specifically say
21 relative proportions, because studies also
22 presented concentrations, and they were not

1 effects on concentrations, there were primarily
2 with the proportions of these fatty acids. So
3 again, some concerns about risk of bias and limited
4 precision and generalizability were some of the
5 concerns the committee had.

6 So, one RCT assessed the relationship
7 between maternal diet based on macronutrient
8 proportions and milk quantity, and there was no
9 association.

10 Also, there was one that looked
11 at -- one RCT -- on the relationship with total
12 protein levels in milk, and there was no
13 association. And the last, one cross-sectional
14 study assessed the relationship between maternal
15 dietary patterns and B12, and this was the study
16 that compared the vegan, vegetarian and
17 non-vegetarian, and while there is no association
18 with dietary patterns, we found that 56 percent of
19 the vegan women were taking a B12 supplement, and
20 so we thought that they were really kind of unable
21 to determine the impact of dietary patterns on B12.

22 So, in terms of the draft conclusion

1 statements, on quantity, there's no evidence
2 available to determine a relationship between
3 dietary patterns and milk quantity, and
4 insufficient evidence to determine a relationship
5 on maternal diets differing in macronutrient
6 distribution during lactation and milk quantity.

7 Again, similar -- so for total protein,
8 no evidence for dietary patterns and no evidence
9 for dietary patterns differing in macronutrient
10 composition. And for B12, again, insufficient
11 evidence is available to determine the
12 relationship between maternal dietary patterns
13 during lactation and vitamin B12 concentrations in
14 human milk.

15 So, there were no studies found that
16 assessed the relationship between maternal dietary
17 patterns and human milk levels of these other
18 nutrients that were part of our framework, so our
19 water-soluble vitamins, fat-soluble vitamins,
20 iodine, selenium, human milk oligosaccharides or
21 bioactive proteins.

22 So, I'm not going to read all these, but

1 basically these are the draft conclusion
2 statements that there was no evidence, and so all
3 are grades not assignable.

4 So now I just -- we'll go through
5 summarizing the results from the existing NESR
6 reviews. So as was mentioned, as part of the
7 Pregnancy B-24 project, there were four systematic
8 reviews that were conducted that are pertinent to
9 the Pregnancy and Lactation Subcommittee.

10 So, the first was the relationship
11 between dietary patterns during pregnancy and the
12 risk of hypertensive disorders during pregnancy,
13 and the second was risk of gestational diabetes.

14 Then there were two systematic reviews
15 looking at dietary patterns during pregnancy on
16 infant outcomes, so gestational age at birth and
17 birth weight standardized by gestational age and
18 sex.

19 So we are, as I mentioned, adopting the
20 existing reviews. But new protocols are posted on
21 DietaryGuidelines.gov. So again, if you're
22 interested in the complete documentation, they're

1 available at DietaryGuidelines.gov.

2 In addition, just to acknowledge this
3 was the member of the Pregnancy Technical Expert
4 Collaborative, or TEC, who worked on this and
5 drafted the conclusions. And these four
6 systematic reviews, as with the ones that Kay
7 mentioned, were published in the American Journal
8 of Clinical Nutrition in 2019.

9 So, the two maternal outcome systematic
10 reviews were combined in one paper, and the two
11 infant systematic -- pregnancy outcome, birth
12 outcomes, were in another. So you can not only
13 review the actual results of the systematic reviews
14 on DietaryGuidelines.gov. But, you can also refer
15 to these manuscripts.

16 So just to briefly review the evidence,
17 so for the first, what is the relationship between
18 dietary patterns during pregnancy and the risk of
19 hypertensive disorders?

20 So, this systematic review included
21 eight studies from four cohorts and one RTC, and
22 this was over a 37-year range of evidence. So,

1 I'll just reiterate, and I mentioned before what
2 Kay mentioned, but we also did then look to see what
3 was published after January 2017 in order to make
4 our final decision on whether we would go ahead and
5 accept the existing reviews.

6 So for these questions related to
7 dietary patterns and risk of hypertensive
8 disorders, the limited evidence in healthy
9 Caucasian women with access to health care suggest
10 the dietary patterns before and during pregnancy
11 higher in vegetables, fruits, whole grains, nuts,
12 legumes, fish and vegetable oils and lower in meats
13 and refined grains are associated with reduced risk
14 of hypertensive disorders during pregnancy,
15 including preeclampsia and gestational
16 hypertension.

17 Not all components of the assessed
18 dietary patterns were associated with all
19 hypertensive disorders. So limited -- the grade
20 was limited.

21 Evidence is insufficient to estimate
22 the association between dietary patterns before

1 and during pregnancy and the risk of hypertensive
2 disorders in minority women and those of lower
3 socioeconomic status. So, grade not assignable.

4 So, the relationship between dietary
5 patterns during pregnancy and gestational
6 diabetes. This was -- included 10 prospective
7 cohorts and one pilot RCT, again, collected between
8 publication January 1980 and January 2017.

9 So, this systematic review concluded
10 there was limited but consistent evidence
11 suggesting certain dietary patterns before
12 pregnancy are associated with a reduced risk of
13 gestational diabetes.

14 These protective dietary patterns are
15 higher in fruits, vegetables, whole grains, nuts,
16 legumes and fish, and lower in bread and processed
17 meats. Most of the research was conducted in
18 healthy Caucasian women with access to health care.

19 Evidence is insufficient to estimate
20 the association between dietary patterns during
21 pregnancy and the risk of gestational diabetes.
22 So, again a conclusion on diet before pregnancy,

1 but not actually during pregnancy, so grade not
2 assignable.

3 So, in turning now to the infant
4 outcomes. The relationship between dietary
5 patterns in pregnancy and gestational age at birth.
6 There were 10 prospective cohorts and one RCT,
7 again, over the same time range.

8 So, limited but consistent evidence
9 suggests that certain dietary patterns during
10 pregnancy are associated with lower risk of preterm
11 birth and spontaneous preterm birth. Protective
12 dietary patterns are higher in vegetables, fruits,
13 whole grains, nuts, legumes and seeds, and seafood,
14 for preterm birth only; and lower in red meat,
15 processed meats, and fried foods. Again, noting
16 a limitation, most of the research was conducted
17 in healthy Caucasian women with access to health
18 care.

19 And this is kind of the opposite, that
20 the evidence was insufficient to estimate the
21 association on dietary patterns before pregnancy
22 and gestational age at birth, as well as preterm

1 birth.

2 So, the last relationship between
3 dietary patterns during pregnancy and birth
4 weights, standardized by gestational age and sex,
5 there were 18 prospective cohorts, one
6 retrospective cohort, and two randomized
7 controlled trials.

8 So, the conclusion is that no
9 conclusion can be drawn on the association between
10 dietary patterns during pregnancy and birth weight
11 outcomes. Although research is available, the
12 ability to draw conclusions is restricted by
13 inconsistency of study findings, inadequate
14 adjustment of birth weight for gestational age and
15 sex, and variation in study design, dietary
16 assessment methodology, and adjustment for key
17 confounding factors.

18 And insufficient evidence exists to
19 estimate the association between dietary patterns
20 before pregnancy and birth weight outcomes. In
21 this case, there were not enough studies available
22 to answer the question.

1 So, our ongoing work is -- I mentioned
2 that we are refining and prioritizing work on
3 dietary patterns during pregnancy and
4 micronutrient status; dietary patterns during
5 lactation and developmental milestones of the
6 child, including neurocognitive development; and
7 dietary supplements and fortified foods for all the
8 other nutrients besides folate.

9 So as noted, we'll review the evidence,
10 grade, and draft conclusion statements for these
11 following questions: dietary patterns in
12 pregnancy and gestational weight gain; patterns
13 during lactation and postpartum weight loss; the
14 maternal diet during pregnancy and lactation on the
15 risk of child food allergies and atopic diseases.
16 And the plan is then to present these at the meeting
17 in March.

18 So again, thanking the subcommittee
19 members, as well as our support staff, which we
20 would not be able to get through all of this work
21 without all their hard behind-the-work scenes.

22 So, I will be happy to take questions.

1 (Applause.)

2 VICE CHAIR KLEINMAN: That was a great
3 summary. So, any questions from the Committee?
4 Rick?

5 MEMBER MATTES: Only one this time.
6 Rick Mattes. So, what's known about the validity
7 of self-reported supplement use during pregnancy
8 and lactation? Is it different from the general
9 population? Can we believe this data more or less
10 than general studies about diet and outcomes?

11 And in any of these trials, was there
12 objective verification of compliance with a
13 prescribed dose?

14 MEMBER BAILEY: So, you can get a
15 compliance sometimes in a clinical trial -- this
16 is Regan answering with Sharon, not for Sharon.
17 So, there are ways to look at the supplements by
18 putting PABA in and getting recovery from urine,
19 so that's one way to test it.

20 I can't speak to whether or not that was
21 done in your studies, but I just wanted to make that
22 comment.

1 MEMBER DONOVAN: I think it's a great
2 question, and I don't know if anyone else is aware
3 of studies where they've looked at self-reported
4 compliance of pregnant versus non-pregnant women.

5 Obviously, women during pregnancy may
6 be taking supplements more often and may be more
7 motivated, but I don't think there's the evidence
8 and -- just thinking offhand -- and if anyone can
9 speak to that in terms of the studies that we
10 reported; I'm not sure that anyone actually
11 confirmed intake of the folate supplements.

12 MEMBER STANG: Jamie Stang. Yeah. I
13 was on the Pregnancy TEC, and studies for the most
14 part did not report compliance. I know from
15 unpublished work that the compliance rates start
16 out high, and as you go through pregnancy, they drop
17 off, but in terms of actual published documentation
18 of what that compliance would be, I'm not aware of
19 any.

20 MEMBER MATTES: So just -- this is a
21 comment that may be a good point to add into the
22 discussion of this section.

1 MEMBER DONOVAN: That's a great point,
2 and also research needs -- to have better
3 collection of that type of data.

4 (Off-mic comments.)

5 MEMBER DONOVAN: Perfect.

6 MEMBER BOUSHEY: So, this is Carol
7 Boushey. And I'm looking at the analytical
8 framework for the folic acid with supplements.
9 And you don't have to look at it; you have it
10 memorized. So -- but folic acid and supplements
11 and the fortified foods, before and during
12 pregnancy and lactation.

13 And one of the studies, I think, had 11
14 people or 15 or something like that, and you had
15 said it was a small sample size, and in the
16 frequency-of-eating group, we actually did -- went
17 through the process of figuring out sample size so
18 that we could screen out some of the smaller
19 studies.

20 And I wonder if you might consider doing
21 that for some of your studies, so that you can
22 determine if those studies actually didn't meet

1 sample size.

2 So it wasn't that you, you know, went
3 crazy over it anyway, but still it might be nice
4 to have that documentation.

5 MEMBER DONOVAN: Yeah. No. That's a
6 great point. I remember we had this conversation
7 at the last meeting, and I think -- we also talked
8 about for the RCTs, that, because they're more
9 controlled, that the n was not as -- necessarily
10 as much of a consideration, but I think -- I don't
11 remember if this study with 11 was an RCT or -- so
12 I can't speak to that directly, but I think it's
13 an excellent point.

14 And as you could see, the studies varied
15 from 11 to 45,000, so it's quite a mixed literature
16 that we're trying to assess and draw conclusions
17 from.

18 CHAIR SCHNEEMAN: I had a quick -- this
19 is Barbara Schneeman. I had a question, again,
20 going back to the supplementation.

21 I know that in your protocol, you
22 allowed for multivitamin supplements, and I'm just

1 wondering then, as you went through the data and
2 the evidence where you're trying to then look at
3 the impact of one nutrient, folic acid, how did you
4 deal with the multivitamin side of it?

5 DR. DONOVAN: So, I think when we
6 looked at that then the control group would have
7 had that exposure without the folic acid. So, we
8 didn't just look at folate within a multivitamin
9 supplement alone.

10 So, if they needed, they could have
11 other vitamins without folic acid or those vitamins
12 with the folic acid.

13 VICE CHAIR KLEINMAN: Any other
14 comments or questions? Everybody must be very
15 hungry.

16 (No response.)

17 VICE CHAIR KLEINMAN: All right, then.
18 Any concluding remarks?

19 CHAIR SCHNEEMAN: My only concluding
20 remarks would be to thank the subcommittees, you've
21 covered a lot of information in a -- in actually
22 a relatively short period of time, and also thank

1 you to the staff for the work that's done to help
2 pull this together.

3 So, I think -- you know, our next
4 subcommittee is doing to be Dietary Fats and
5 Seafood Subcommittee, but I think we're best to
6 start that after the lunch break, because I know
7 they have a lot to report back on as well. Correct?

8 So, I'll just open it up to the
9 Committee. Do you have any general comments at
10 this point before we break, particularly if you
11 start to see things where you're seeing threads
12 across the different subcommittee work or things
13 that sort of tie these areas together?

14 (No response.)

15 VICE CHAIR KLEINMAN: Hunger wins.

16 CHAIR SCHNEEMAN: Okay. So, we'll
17 adjourn for now, and then reconvene at one o'clock,
18 and it is important that we start at one o'clock,
19 because that's for the webinar folks. That's when
20 we'll start the YouTube again.

21 So have a good lunch.

22 (A lunch recess was taken.)

1 CHAIR SCHNEEMAN: It's time to get
2 started, and I think they have the YouTube set up.
3 Just a couple of reminders to the Committee: A
4 couple of people pointed out that they couldn't
5 hear as well, so when you're using the microphone,
6 please make sure it's in front of you when you use
7 the microphone, just to make sure people can hear
8 the questions.

9 And I just want to repeat something that
10 I said in my opening remarks, that what you're
11 hearing are summary statements, draft conclusions,
12 and they're being presented here for the full
13 Committee consideration in their decision-making
14 process.

15 And the final decisions are what will
16 be in the report. So I just want to, once again,
17 highlight that what you're hearing about our draft
18 conclusions, summaries of statements.

19 The committee themselves are looking in
20 much more detail at all of the publications that
21 are being presented. So with that, we're ready to
22 go to our next subcommittee report, and that's the

1 Dietary Fats and Seafood Subcommittee.

2 Dr. Linda Snetselaar is going to give
3 the report.

4 MEMBER SNETSELAAR: I want to
5 acknowledge my committee, Dr. Regan Bailey, Joan
6 Sabaté, and Linda Van Horn, who is here by phone,
7 and also our Advisory Chair, Barbara Schneeman.

8 The NESR, or NESR staff, is
9 implementing protocols for the first two dietary
10 questions that you see on this particular slide,
11 and the topics will be addressed at a future
12 Advisory Committee meeting.

13 We will be presenting a summary of the
14 evidence, draft conclusion statements, and grades
15 on the three seafood questions today. They are in
16 red. And the remaining questions focus on dietary
17 fats and neurocognitive outcomes, along with
18 dietary fats and cancer.

19 As a reminder, we are defining seafood
20 in the following manner. It is marine animals that
21 live in the sea and in freshwater lakes and rivers,
22 and seafood here includes fish and shellfish.

1 And this particular slide is designed
2 to sort of orient you to the three questions that
3 we will be focusing on today during my
4 presentation, and we're doing this because the
5 first two questions have a lot of similarities and
6 some subtle differences.

7 The first question is seafood intake
8 during pregnancy or lactation and neurocognitive
9 development of the child. And the second question
10 is seafood intake during childhood and adolescence
11 and neurocognitive outcomes.

12 As you will see in the upcoming slides,
13 there are many neurocognitive outcomes, and it's
14 easy to get confused between these two questions
15 and the various outcomes on which we are reporting.

16 Because the neurocognitive outcomes
17 are varied and most studies did not examine all
18 components of the outcomes, we decided to develop
19 separate conclusion statements for each component.

20 And then the third question, the
21 seafood question here, is looking at seafood intake
22 during childhood and adolescence and

1 cardiovascular disease outcomes.

2 So the first question we addressed was,
3 what is the relationship between seafood
4 consumption during pregnancy and lactation and
5 neurocognitive development of the infant?

6 And we used NESR systematic review to
7 answer this particular question. As a refresher,
8 here is the analytic framework we used to approach
9 this question. And we did review this framework
10 in detail during the July Advisory Committee
11 meeting.

12 And in this question, the exposure was
13 assessed in pregnant and lactating women, and the
14 outcome was measured in children, birth to 18
15 years. This is a reminder of the specific
16 intervention exposure and comparators that we
17 focused on.

18 The criteria apply to all of our seafood
19 protocols. And the particular item here to note
20 is that studies must measure seafood consumption.
21 So biomarkers of seafood intake, which might
22 include fish oil or omega-3 polyunsaturated fatty

1 acid supplement studies, or studies that evaluated
2 infant formula with added DHA or EPA were not
3 included.

4 This flowchart illustrates the
5 literature search and screening results for two
6 systematic review questions related to seafood
7 consumption and neurocognitive outcomes. One
8 question addresses seafood intake during pregnancy
9 and lactation, and the second question, as I noted
10 before, addresses seafood intake during childhood.

11 There were 25 studies that were
12 included in this review of seafood consumption
13 during pregnancy and lactation and neurocognitive
14 development of the infant, and that's highlighted
15 in red there.

16 As a reminder, we decided to develop
17 separate conclusion statements for each
18 neurocognitive outcome. The outcomes shown in
19 blue here are the ones we presented draft
20 conclusion statements for during the October
21 public meeting.

22 And I'm going to briefly review these

1 draft conclusion statements that have been
2 previously presented. So as a review from the
3 October public meeting, our subcommittee found
4 insufficient evidence was available to determine
5 the relationship between seafood intake during
6 pregnancy and attention deficit disorder, ADD;
7 also attention deficit hyperactivity disorder,
8 ADHD; and autism spectrum disorder-like traits or
9 behaviors or an ASD diagnosis in a child.

10 And due to there being no included
11 studies examining the bottom three outcomes, no
12 evidence was available to determine the
13 relationship between seafood intake during
14 pregnancy and academic performance, anxiety, and
15 depression.

16 The grade was not assignable for all of
17 these outcomes, and that then concludes our review
18 of the statements presented at the last public
19 meeting.

20 I will now present draft conclusion
21 statements for the developmental domain outcomes
22 for the very same question: What is the

1 relationship between seafood consumption during
2 pregnancy and lactation and neurocognitive
3 development of the infant?

4 Our subcommittee reviewed evidence
5 pertaining to four developmental domains, and they
6 are shown here on this slide, and we then drafted
7 conclusion statements for each. This evidence was
8 reported during the last public meeting, but it
9 does bear repeating.

10 No studies that met inclusion criteria
11 assessed the relationship between maternal seafood
12 intake during lactation and neurocognitive
13 outcomes, including developmental domains in the
14 child.

15 Twenty-four articles from 18
16 prospective cohort studies assessed seafood intake
17 during pregnancy and developmental domains
18 outcomes. These studies were primarily conducted
19 in the U.S. and also in Europe.

20 Maternal seafood exposure was
21 primarily measured using food frequency
22 questionnaires, though the timing, the type, and

1 the amounts of seafood intake were varied. The
2 categorization of seafood intake also varied
3 across studies, so that one study might look at
4 quintiles, and another study might look at servings
5 per week. There was a variety of assessment tools
6 used within each outcome domain. Now I
7 will focus on the first domain, developmental
8 domain, cognitive development. There were 20
9 articles from 15 prospective cohorts which met
10 inclusionary criteria.

11 The majority of the studies detected
12 positive or null associations between seafood
13 intake during pregnancy and cognitive development
14 in children five months to 11 years. And then
15 looking at IQ, or composite intelligence measures,
16 that was done in children four to 11 years.

17 Few studies accounted for all of the key
18 confounders, and there was heterogeneity across
19 the studies in seafood intake categories used in
20 analyses and cognitive assessment methods. This
21 tended to limit the specificity of the conclusion.

22 So our draft conclusion statements are

1 moderate evidence suggests that seafood intake
2 during pregnancy is associated with improvements
3 in cognitive development in the child.

4 The grade here is moderate for
5 specifically pregnancy. No evidence is available
6 to determine the relationship between seafood
7 intake during lactation and cognitive development
8 in the child, and the grade here is not assignable,
9 specifically for lactation.

10 Next, we looked at the second
11 developmental domain, language and communication
12 development. There were 14 articles from 12
13 prospective cohorts which met inclusionary
14 criteria.

15 The majority of studies
16 detected a beneficial or null association between
17 seafood intake during pregnancy and language
18 development or verbal IQ in children six months to
19 11 years of age.

20 Few of these studies accounted for key
21 confounders, and there was heterogeneity in
22 maternal seafood intake, such as the timing, during
pregnancy, the type and the amount of seafood

1 intake.

2 Seafood categorization and analysis
3 was varied. Outcome assessment tools and
4 measurements were varied, and the ages of children
5 at assessment was also varied.

6 So our conclusion draft statements are
7 moderate evidence suggests that seafood intake
8 during pregnancy is associated with improvements
9 in language and communication development in the
10 child. The grade here is moderate, specifically
11 for pregnancy.

12 No evidence is available to determine
13 the relationship between seafood intake during
14 lactation and language and communication
15 development in the child. So the grade here is not
16 assignable, specifically for lactation.

17 Then our third developmental domain
18 involved movement and physical development.
19 There were 13 articles from nine prospective
20 cohorts which met the inclusion criteria.

21 The majority of the studies found
22 either null or beneficial associations between

1 seafood intake during pregnancy and movement and
2 physical development in the child. Few of the
3 studies accounted for key confounders, and there
4 was heterogeneity in, again, maternal seafood
5 intake, timing, type and amount, and types of
6 movement and physical development examined were
7 varied.

8 The outcome assessment tools were
9 varied, and the ages of children at follow-up was
10 also varied. Our draft conclusion statement is
11 insufficient evidence is available to determine
12 the relationship between seafood intake during
13 pregnancy and movement and physical development in
14 the child.

15 No evidence is available to determine
16 the relationship between seafood intake during
17 lactation and movement and physical development in
18 the child, so the grade here is not unassignable
19 for pregnancy and lactation.

20 Now, for the fourth developmental
21 domain, social, emotional and behavioral
22 development, there were nine articles from six

1 prospective cohorts which met the inclusion
2 criteria.

3 There were no apparent trends across
4 studies, since there were mostly non-significant
5 associations. There was a concern for risk of
6 bias, which we cared greatly about, and as we're
7 working on these questions, we do focus on this,
8 and this risk of bias was due to few studies
9 accounting for all key confounders, differences in
10 measurement of exposure and outcomes, heavy
11 reliance on parental report for most of the
12 outcomes. And it was difficult to determine the
13 relationship due to heterogeneity. And again,
14 maternal seafood intake, the timing, type and
15 amount, the ages of children at follow-up, six
16 months to 13 years, so variable there, and outcome
17 assessment tools varied. The dimension of social,
18 emotional and behavioral development was also
19 varied in these studies.

20 Our draft conclusion statement is
21 insufficient evidence is available to determine
22 the relationship between seafood intake during

1 pregnancy and social, emotional and behavioral
2 development in the child.

3 No evidence is available to determine
4 the relationship between seafood intake during
5 lactation and social, emotional and behavioral
6 development in the child. And the grade here is
7 not assignable for pregnancy and lactation.

8 Moving on now to question two, this
9 particular question is, what is the relationship
10 between seafood consumption during childhood and
11 adolescence and neurocognitive development? And
12 we did again using NESR's systematic review to
13 answer this particular question.

14 This is the analytic framework we used
15 to approach this question. This was reviewed in
16 detail during the July Advisory Committee meeting,
17 and in that particular meeting, we discussed the
18 exposure, childhood and adolescence, through 18
19 years of age, and the outcome was measured in
20 individuals two years and older.

21 This flowchart highlights studies
22 which met the inclusion criteria. Thirteen

1 studies were included in this review of seafood
2 consumption during childhood and adolescence and
3 neurocognitive development.

4 Thirteen studies from both randomized
5 controlled trials, RCTs, and prospective cohort
6 studies met inclusion criteria for this review.
7 There were six articles from three randomized
8 controlled trials.

9 Two randomized controlled trials
10 evaluated fish intake in children between the ages
11 of four and six, and the intervention for both the
12 RCTs consisted of fatty fish meals compared to meat
13 meals three times a week for 16 weeks.

14 The third RCT, the FINS-TEEN study, was
15 conducted with adolescents 14 to 15 years, and
16 participants in this particular study consumed
17 fish meals compared to meat meals three times a week
18 for 12 weeks.

19 Outcomes were assessed before and after
20 the trial, and assessment tools tended to vary.
21 There were seven articles from six prospective
22 cohort studies which evaluated seafood intake

1 during childhood and neurocognitive development.

2 These studies were done in the U.K. and
3 Sweden and China and Canada. Seafood intake was
4 reported as oily fish or just fish intake, and the
5 majority of studies assessed fish intake using a
6 food frequency questionnaire.

7 Outcomes were assessed in children
8 three to 18 years of age, and there were a variety
9 of assessment tools used. For this particular
10 question, no prospective cohort study accounted
11 for all key confounders.

12 Now I will focus on the evidence which
13 evaluated the developmental domains. The four
14 developmental domains are shown here, along with
15 how many articles. We evaluated outcomes from
16 these specific domains. And the majority of
17 studies were conducted in Northern Europe,
18 particularly in Scandinavian countries.

19 For the first developmental domain,
20 cognitive development, there were seven articles
21 included in our review. Of these seven, four
22 articles were from three randomized controlled

1 trials and three articles were from prospective
2 cohort studies.

3 The four articles from three randomized
4 controlled trials found predominantly null or
5 beneficial effects of seafood, compared to meat
6 meals in children four to six years, and 14- to
7 15-year-old adolescents.

8 There were three articles from three
9 prospective cohorts. Beneficial associations
10 were found between child seafood intake at nine to
11 15 years and cognitive development in children 12
12 to 18 years of age.

13 No association was found between child
14 seafood intake and cognitive development at 3.5
15 years. Our draft conclusion statement then is
16 insufficient evidence is available to determine
17 whether seafood intake during childhood and
18 adolescence is associated with improvements in
19 cognitive development in children and adolescents.
20 Grade not assignable here for a specific
21 improvement.

22 Then moderate evidence suggests that

1 seafood intake during childhood and adolescence
2 does not have detrimental impact on cognitive
3 development in children and adolescents. And
4 here, the grade is moderate relative to no
5 detrimental impact.

6 For the second domain, language and
7 communication development, five articles were
8 included, three from two RCTs and two from
9 prospective cohort studies.

10 Evidence from the two RCTs found no
11 effect of fish compared to meat meals on language
12 and communication development at four to six years
13 in primary analysis. The two prospective cohort
14 studies found a positive association between
15 seafood intake during childhood and adolescence
16 and language and communication development and
17 verbal IQ in children 12 to 18 years of age.

18 Heterogeneity was found in child
19 seafood intake, looking at timing, type, amount and
20 duration, and the age of children at assessment was
21 variable, and outcome assessment tools were also
22 variable in these studies.

1 So our draft conclusion statement here
2 is insufficient evidence is available to determine
3 whether seafood intake during childhood and
4 adolescence is associated with improvements in
5 language and communication development in those
6 children and adolescents. And the grade here is
7 not unassignable, specifically focusing on
8 improvement.

9 Moderate evidence suggests that
10 seafood intake during childhood and adolescence
11 does not have detrimental impacts on language and
12 communication development in children and
13 adolescents. The grade is moderate for no
14 detrimental impact.

15 For the third domain, movement and
16 physical development, there were two randomized
17 controlled trials included in our review. Both
18 randomized controlled trials used the nine-hole
19 peg test as the assessment tool.

20 In children four to six years of age,
21 intake of fatty fish meals compared to meat meals
22 have predominantly null effects on manual

1 dexterity and fine motor coordination.

2 One study found that fish meals had a
3 beneficial effects on fine manual dexterity, and
4 the fine motor coordination only applied in the
5 non-dominant hand.

6 Due to limited amounts of studies, our
7 draft conclusion statement is insufficient
8 evidence is available to determine the
9 relationship between seafood intake during
10 childhood and movement and physical development in
11 children. The grade here is not assignable.

12 For the fourth domain then, social,
13 emotional and behavioral development, three
14 studies were included in the review, two randomized
15 controlled trials. One was conducted in four- to
16 six-year-olds, and one in 14- to 15-year-olds, and
17 they did not find a significant effect of fish meals
18 compared to meat meals on change in behavioral
19 symptoms in primary analysis.

20 In the one article from the one
21 prospective cohort study, there was a null
22 association between seafood intake at three years

1 and social, emotional and behavioral development
2 in children at four to 13 years of age.

3 All of these studies used strength -- a
4 strength and difficulties questionnaire, and there
5 was heterogeneity in the ages of the children at
6 intervention, exposure and outcome assessment.
7 And child seafood intake varied in terms of timing,
8 type, amount and duration.

9 Our draft conclusion statement is
10 insufficient evidence is available to determine
11 the relationship between seafood intake during
12 childhood and adolescence and social, emotional
13 and behavioral development in children and
14 adolescents, and the grade here is not assignable.

15 So moving on to attention deficit
16 disorder, ADD; and attention deficit hyperactivity
17 disorder, ADHD-like behavior for seafood intake
18 during childhood and adolescence, there were two
19 randomized controlled trials included in our
20 review, and these studies found fish meals three
21 times a week compared to meat meals had a null
22 effect on ADD, ADHD-like behavior at four to six

1 years, and 14 to 15 years.

2 It was difficult to determine a
3 relationship due to the inadequate number of
4 studies, and outcome assessment relied mostly on
5 parental report.

6 So our draft conclusion statement is
7 insufficient evidence is available to determine
8 the relationship between seafood consumption
9 during childhood and adolescence and attention
10 deficit disorder or attention deficit
11 hyperactivity disorder-like traits or behaviors.
12 And the grade here then is not assignable.

13 No studies included examined autism
14 spectrum disorder as an outcome. Therefore, our
15 draft conclusion statement is no evidence is
16 available to determine the relationship between
17 seafood intake during childhood and adolescence
18 and autism spectrum disorder-like traits or
19 behaviors or autism spectrum disorder diagnosis,
20 and here the grade is not assignable.

21 Moving onto academic performance for
22 seafood intake during childhood and adolescence,

1 there was one prospective cohort study included in
2 our review, and this study found a significant
3 positive association between frequency of
4 consumption of meals containing fish at 15 years
5 and higher total school grade at 16 years.

6 However, it's important to keep in mind
7 that it's difficult to determine a conclusion here
8 due to an inadequate number of studies and concern
9 for risk of bias from measurement of exposure and
10 outcome.

11 So our draft conclusion statement is
12 insufficient evidence is available to determine
13 the relationship between seafood consumption
14 during adolescence and academic performance in
15 those adolescents. And the grade here is not
16 assignable.

17 For the outcomes of anxiety and
18 depression for seafood intake during childhood and
19 adolescence, there were two prospective cohort
20 studies included in our review.

21 One prospective cohort study found a
22 significant positive association between greater

1 fish intake at 10 to 11 years and lower odds of the
2 diagnosis of internalizing disorder; that included
3 anxiety or depression at 10 to 14 years.

4 And then one prospective study did not
5 find an association between fish intake at 14.5
6 years and depressive symptoms at 17.5 years. It's
7 difficult to determine a relationship here due to
8 an inadequate number of studies, inconsistent
9 results, and little information describing
10 exposure.

11 So our draft conclusion statement is
12 insufficient evidence is available to determine
13 the relationship between seafood consumption
14 during childhood and adolescence and anxiety and
15 depression in children and adolescents. The grade
16 here is not assignable.

17 No included studies examined
18 neurocognitive health in adulthood as an outcome,
19 and therefore our draft conclusion statement is no
20 evidence is available to determine the
21 relationship between seafood intake during
22 childhood and adolescence and neurocognitive

1 health, which includes cognitive decline, anxiety,
2 and depression in adulthood, and the grade here is
3 not assignable.

4 That concludes our review of the second
5 seafood question.

6 And the third seafood question we
7 reviewed was, what is the relationship between
8 seafood consumption during childhood and
9 adolescence and risk of cardiovascular disease, so
10 we're moving away from the neurocognitive area.

11 We used NESR's systematic review to
12 answer this particular question. This is the
13 analytic framework we used to approach this
14 particular question.

15 This was reviewed in detail during the
16 July Advisory Committee meeting, and in this
17 question, the seafood exposure was assessed in
18 childhood and adolescence through age 18 years of
19 age, and intermediate outcomes were measured in
20 children and adults, while endpoint outcomes were
21 only measured in adults.

22 This is a flowchart for the literature

1 search and screening results for the third seafood
2 question addressing seafood intake during
3 childhood and adolescence and risk of
4 cardiovascular disease.

5 And there were four studies included.
6 Of the four studies included, two were randomized
7 controlled trials. In both randomized controlled
8 trials, children were 10 to 12 years of age.

9 The first study provided children with
10 school meals, and that included either 100 grams
11 of oily fish or a cheese salad sandwich five times
12 per week for 12 weeks. The second randomized
13 controlled trial provided schoolchildren with six,
14 seven or eight grams of tuna fish. And the
15 intervention frequency, duration and control
16 conditions in this particular study were not
17 recorded. These studies measured blood pressure
18 and blood lipids.

19 The other two studies included in the
20 review were prospective cohort studies, and one
21 study assessed fish intake of 10 years using a
22 seven-day food record at baseline, three and six

1 months, and outcomes were assessed looking at blood
2 pressure and blood lipids.

3 The other study assessed fish and oily
4 fish intake at 7.5 years. This was done in the late
5 1930s, and it included a household inventory. And
6 those outcomes looked at were stroke mortality and
7 coronary heart disease mortality, and these
8 particular outcomes were measured during 60 years
9 of follow-up.

10 Results from the few available studies
11 were not consistent. It's difficult to determine
12 a relationship due to an inadequate number of
13 studies and serious methodological limitations in
14 some of the studies.

15 So our draft conclusion statement here
16 is insufficient evidence is currently available to
17 accurately determine the relationship between
18 seafood consumption during childhood and
19 adolescence and risk of developing cardiovascular
20 disease. The grade here is not assignable.

21 We have completed the systematic review
22 of the three seafood questions, and these now will

1 undergo peer review, and we will begin drafting
2 this section of the report.

3 Our subcommittee will now move to
4 examining dietary fats with a series of questions
5 related to that topic, and we will be starting with
6 the relationship between dietary fat and risk of
7 cardiovascular disease.

8 I want to thank the subcommittee
9 members, and additionally thank the staff for the
10 huge amount of work that goes into doing these
11 systematic reviews, and thank you all for being
12 here today to listen to what we have synthesized
13 relative to this particular topic.

14 Thank you.

15 (Applause.)

16 CHAIR SCHNEEMAN: So if we could have
17 comments or questions from the Committee?

18 MEMBER DEWEY: Thank you very much.
19 That was very clear and nicely laid out. The
20 question has mainly to do with the seafood intake
21 during childhood and adolescence and cognitive
22 development outcomes.

1 As I recall, there were three
2 randomized controlled trials, but the duration of
3 those was 12 or 16 weeks, and so the question is
4 whether you think it's plausible that that's long
5 enough to create the kind of tissue changes that
6 one might think would be the link between seafood
7 and something in the brain?

8 And if it's not long enough, you know,
9 what is the feasibility of addressing that question
10 with randomized controlled trials of sufficient
11 duration? And should we then look more carefully
12 at the prospective cohort studies?

13 In that situation, I think you said
14 there were three, and that two showed a
15 relationship, and one with the younger age group
16 does not.

17 So in this situation, the value of
18 prospective cohort studies might be pretty high,
19 and I would like to know what your group felt were
20 the key limitations that led you, I think, to the
21 conclusion of insufficient evidence, despite those
22 positive relationships?

1 MEMBER SNETSELAAR: Yes. I think we
2 did look at type of study. You're right. I do
3 think that in many instances -- and we are coming
4 up with some future direction kinds of things, that
5 it would be great to certainly include more
6 prospective studies possibly.

7 But in addition to that, we as a
8 committee have looked at what are some of the
9 concerns that went into looking at prospective
10 studies and, in addition, randomized controlled
11 trials?

12 And do we need additional studies that
13 would focus on more consistency among the
14 assessment, the timing, those things, the duration
15 of the study, those kinds of things. So I think
16 everything you're bringing up is 100 percent
17 correct.

18 We looked at this and came to a
19 conclusion. I think that one of the things
20 following a list of our conclusions is to work
21 closely with your committee as well and come up with
22 some final conclusions that would incorporate both

1 ideas from your committee, and the work your
2 committee has done as well, along with our
3 committee, has been helpful.

4 MEMBER DEWEY: If I could just follow
5 up with that? I don't think you mentioned it, I
6 did know that you didn't find any studies for
7 exposure from birth to 24 months and where the
8 outcome was assessed after 24 months of age.

9 So we actually don't have anything to
10 say about seafood consumption in the first two
11 years of life and developmental outcomes.

12 MEMBER SNETSELAAR: So that may be a
13 future direction.

14 MEMBER DEWEY: Yeah.

15 VICE CHAIR KLEINMAN: Linda, that was
16 just great. My question is about, again,
17 neurocognitive outcomes and the positive results
18 of seafood consumption during pregnancy. And I
19 wonder, is there a dose-response in those studies
20 or was that examined, I guess?

21 And then a second question was, you
22 noted that none of those studies adequately

1 controlled for confounders. And I'm wondering
2 whether the effect diminished significantly when
3 confounders were considered?

4 MEMBER SNETSELAAR: Yes. I think -- I
5 remember beginning to talk about this question, and
6 then working very carefully on what should our
7 confounders be? Because the more confounders you
8 have, the more likely you are to end up with no
9 results.

10 And so you know, I think that's an
11 important question. It was just something that
12 came up again and again, but particularly the
13 prospective cohort studies. And then what was
14 your first question again? I'm sorry.

15 VICE CHAIR KLEINMAN: Whether there is
16 a dosed response in consumption of seafood and the
17 outcome. So, as the exposure increased -- did any
18 of the studies look at increasing exposure and the
19 consequence of that, to lend more credibility to
20 the intervention?

21 MEMBER SNETSELAAR: Yeah. I think we
22 need more studies on, certainly, increased

1 exposure, more specifics on the studies we looked
2 at, I'd look to our NESR team to answer that
3 question.

4 But certainly, exposure is incredibly
5 important. And when you look at the amount of
6 seafood in some of the studies, it was incredibly
7 small.

8 CHAIR SCHNEEMAN: Dr. Sabaté.

9 MEMBER SABATÉ: In some of the studies,
10 and I don't remember exactly which on the slide,
11 as far as answering your question on the
12 dose-response, I mean in some studies it was flat.

13 I mean, for some studies there was a
14 dose response and others had a U-shape. So the
15 intermediate, I mean, had some relationship at the
16 highest amount -- I mean, lower back to no
17 exposure, so it had a U-shape in some of the
18 studies.

19 MEMBER BAILEY: There was a lot of
20 variability. Some studies reported fish intake in
21 grams, others reported it in servings, and so it
22 was kind of hard to synthesize how much actually

1 was the exposure.

2 MEMBER NAIMI: Tim Naimi, Boston
3 University. Linda, that was a really nice
4 presentation, and I guess my question is similar
5 to Ron's and related also to the dose-response, but
6 more along the lines of -- for those ones in which
7 you had exclusively observational studies and none
8 of them had all of the key confounders, and you know
9 the confounding is likely to bias in the direction
10 you found, can you talk about giving it a moderate
11 evidence grade, as opposed to a limited one? I
12 guess that's where I feel a little bit
13 uncomfortable.

14 VICE CHAIR KLEINMAN: I didn't push
15 that far, but that's where I was going as well.

16 MEMBER SNETSELAAR: I think that's a
17 very good point, and certainly, as we look at these
18 conclusion statements, again, these are not carved
19 in stone, as Barbara has been mentioning several
20 times.

21 And I think as we look at these
22 statements and maybe work with some of the other

1 subcommittees, we may make some changes. So very
2 good point.

3 MEMBER BAILEY: For most of the studies
4 there was a beneficial association or a null
5 association, and so we really -- I think there was
6 one study in one subgroup that there was a
7 detrimental association.

8 So the vast majority of the literature
9 was either beneficial or null, which is why we went
10 with a moderate, because of all of the
11 consistency -- and the inconsistency.

12 MEMBER SNETSELAAR: But those
13 decisions were hard-fought and we spent a great
14 deal of time thinking about it.

15 MEMBER SCHNEEMAN: But certainly part
16 of the point here is from the discussion for the
17 subcommittee to take the information and consider
18 the points being raised, also to look where we need
19 cross-talk between the subcommittees.

20 MEMBER MATTES: Rick Mattes. Two
21 questions that are bit more global. So your group,
22 I think singularly reports effects of positive and

1 negative, and in this case, there was no
2 significant effect, which could also be said
3 there's no association, which is the way all the
4 rest of our recommendations seem to read, and I
5 think we should be consistent.

6 Either we're going to say that there's
7 effects this way or that way, or we're just going
8 to say there's no association, and that difference
9 is between the groups now. We --

10 MEMBER SNETSELAAR: Yes. And --

11 MEMBER MATTES: -- probably can report
12 that --

13 MEMBER SNETSELAAR: Yeah. I think
14 your 100 percent correct, that we do need to be very
15 consistent across the subcommittees. And I think
16 that process is being thought about, and will be
17 in the works soon.

18 MEMBER MATTES: One other, in terms of
19 consistency. So in at least one other subgroup,
20 where you have -- like your question one you have
21 all prospective cohort studies. Did you downgrade
22 trials that only had a single estimate of intake

1 at baseline and then track for 10 years and look
2 at an outcome, as opposed to trials that repeated,
3 say, a food frequency question or whatever, so you
4 have some sense that that level of exposure was
5 maintained during that 10-year interval or that the
6 response on that question there was reliable.

7 We held, in another group, a higher
8 standard, and I'm just wondering how you use that?

9 MEMBER SNETSELAAR: Good question.
10 Can I defer to Joanne?

11 MS. SPAHN: What was the question?
12 Specifically address seafood intake during
13 pregnancy.

14 (Off-mic comments.)

15 MS. SPAHN: So when we extracted the
16 data, there were maybe a third and maybe a little
17 less than a third of the studies that measured
18 seafood intake more than once during pregnancy, and
19 then during childhood, the tables will indicate
20 whether or not there were repeat measures.

21 Certainly, the RCTs, you know, were a
22 definitive measure of time. I don't recall the

1 childhood having a lot of repeat measures.

2 MEMBER MATTES: Yeah. I would just
3 suggest that when you assign the strength, that
4 that would be a factor that you put into the
5 consideration.

6 MEMBER SABATÉ: Joan Sabaté. I think
7 this is a good point. I recall in the discussions,
8 and I think there was no studies which had repeated
9 measures in childhood that I remember.

10 MEMBER DEWEY: Kay Dewey. I want to
11 follow up on the comment about -- I think you
12 mentioned, Rick, the statement that said that
13 moderate evidence suggests that seafood intake
14 during childhood and adolescence does not have
15 detrimental impact, and that's been one that you
16 thought you'd just say there's no association?

17 Is that the one you were --

18 MEMBER MATTES: Well, there are --

19 MEMBER DEWEY: -- referring to?

20 MEMBER MATTES: -- a couple where there
21 is a report of whatever the evidence is pro and
22 whatever the evidence is negative, in no case was

1 there a significant association in either
2 direction.

3 In some cases, there was insufficient
4 evidence, but if there's evidence of no
5 detrimental, is that different from no evidence of
6 association?

7 MEMBER DEWEY: Right. And so I just
8 want to clarify that we're talking about the same
9 conclusion statement. And I'm not sure if this is
10 explained, but my understanding is that this was
11 driven in part by the concern about mercury
12 exposure, and that there is the concern about
13 detrimental effects.

14 MEMBER SNETSELAAR: Uh-huh.

15 MEMBER DEWEY: Now -- so in -- on one
16 hand, I think having a statement about no harm is
17 useful, but on the other hand, the way you approach
18 that question is different than when you're trying
19 to show a relationship in the sense of it being a
20 safety kind of study analysis.

21 And so I don't know if the studies
22 looked at it the right way in terms of ruling out

1 harm, which is different from the way you approach
2 it when you are saying that there is a benefit.

3 So that might be something to look at
4 again. If they did it the appropriate way --

5 MEMBER SNETSELAAR: Uh-huh.

6 MEMBER DEWEY: -- I think it's
7 important to say that --

8 MEMBER SNETSELAAR: Uh-huh.

9 MEMBER DEWEY: -- and which -- how many
10 did, because if the statement is possible about no
11 harm, that would be extremely useful.

12 MEMBER SNETSELAAR: Good point.

13 Thank you.

14 MEMBER SABATÉ: Again, Joan Sabaté.

15 The no harm relates to the cognition, not to any
16 other factors. You know we had a series of studies
17 -- maybe 14 or 15, I don't remember of which only
18 two or three seems to have some relationship that
19 was significant, one with a U-shape included, but
20 many had basically flat, no relationship.

21 So we can do the conclusion that seems
22 there was none that has a detrimental effect as far

1 as cognition. And we can do this conclusion. The
2 no harm relates only to cognition, not to any other
3 parameter. As far as the studies, especially the
4 prospective studies, not all, as a matter of fact,
5 if I remember correctly, many of them were not
6 originally designed to test the fish effect; it was
7 mainly to design the harmful effects of mercury.

8 And by the way, in the second
9 publication, there was something as far as the
10 consumption of fish and cognition. So we have some
11 of the studies of the prospective studies that were
12 not originally designed for, you know, fish intake
13 and cognition.

14 MEMBER ARD: Jamy Ard. So just to
15 continue on in terms of how we're describing
16 certain effects, my initial impression if, after
17 seeing the words around -- associated with
18 "improvements in," et cetera, makes me feel like
19 that's a treatment effect or that something started
20 from a deficit, and I don't know if that is shared
21 by others, but I just wanted to share that, in terms
22 of it's not the same to me as something that might

1 say it had a beneficial effect or -- I don't know
2 exactly the other ways that you -- these things are
3 quantified in terms of cognition or language and
4 communication and those types of things.

5 But that may be something to think
6 about.

7 MEMBER SNETSELAAR: Good point.

8 MEMBER NOVOTNY: Rachel Novotny.
9 This is a little bit out of place, but related to
10 this conversation about language and how we're
11 reporting -- and it makes me wonder with most of
12 our questions whether we don't want to consider
13 both protective effects.

14 At any rate, to consider whether
15 there's another pass at our questions for some of
16 these things, I'm thinking specifically about --
17 which I've been talking to Sharon about -- the upper
18 limit for folic acid, which was not specifically
19 our question, but it feels like we should say
20 something about that.

21 So we may need to make another pass at
22 our studies as well to see if there's something we

1 could legitimately say about that. I think it's
2 a general question for us as to whether we're
3 considered sort of both ends of the spectrum for
4 many of our questions.

5 CHAIR SCHNEEMAN: Other comments or
6 questions?

7 MEMBER BAILEY: Linda Van Horn is on
8 the line, I don't know if she - if we want to give
9 her an opportunity to comment, or if she has
10 anything to say.

11 CHAIR SCHNEEMAN: Is she on the line?
12 She is mainly listening, so she'll let us know.

13 (Laughter.)

14 CHAIR SCHNEEMAN: I think these were
15 all useful comments for the subcommittee to take
16 back and look at.

17 MEMBER SNETSELAAR: Uh-huh.

18 CHAIR SCHNEEMAN: And also working
19 with the staff to make sure we do have consistency
20 across the subcommittee. So I think then we'll
21 move to our next subcommittee report, which is the
22 Beverages and Added Sugars subcommittee, and Dr.

1 Mayer-Davis will do that report.

2 MEMBER MAYER-DAVIS: Thank you very
3 much. So first I do want to recognize the great
4 work of the Committee, Drs. Leidy, Mattes, Naimi
5 and Novotny, and Schneeman, to say nothing of, of
6 course, the NESR staff that just continues to amaze
7 us every day.

8 So let's see. I'm clicking the
9 clicker, but see myself instead of a slide. That's
10 not really that I want to see, actually. So let's
11 see. What do I need to do here? Oh, that's way
12 farther than I need to be.

13 Let's see.

14 (Pause.)

15 MEMBER MAYER-DAVIS: All right.

16 There we go. So let me just overview what we will
17 go over in this session today. This is just a brief
18 summary of the questions that we addressing in this
19 particular committee, questions related to
20 non-alcoholic beverages, added sugars and alcohol.

21 So we have completed our work towards
22 our draft conclusions for birth weight

1 standardized for gestational age and sex as an
2 outcome related to non-alcohol beverages underway;
3 a set of questions related to various non-alcoholic
4 beverages in relation growth, size, body
5 composition, and risk of overweight and obesity,
6 for which there's been a screening of some 17,000
7 articles and 214 articles identified to be included
8 for that set of questions, with 70 articles
9 currently under review for a subset of questions
10 that are focused on milk.

11 I won't be presenting details on that
12 particular piece today because that is -- we are
13 in the midst of that effort. Also underway are
14 questions related to added sugars and risk of
15 cardiovascular disease, screening is underway
16 relatively early on for that with 5,000 articles
17 screened.

18 Coming up next are questions related to
19 added sugars and risk of type 2 diabetes and also
20 outcomes of growth, size, body composition, and
21 risk of overweight and obesity.

22 We are also working on questions

1 related to alcohol and all-cause mortality, and I
2 will be presenting some more information about that
3 today, as well as presenting information about
4 non-alcoholic beverages and birth weight.

5 So that's the overview. So now we will
6 focus on this particular question that you see here
7 on the screen. What is the relationship between
8 beverage consumption during pregnancy and birth
9 weight standardized for gestational age and sex?
10 And this is approached via the NESR systematic
11 review process.

12 This is our analytic framework, and I
13 do want to take a moment on this, because there are
14 actually quite a large number of decisions embedded
15 in this analytic framework that took a fair amount
16 of time to sort through and that follow for much
17 of our work for a range of questions.

18 So you'll see in terms of intervention
19 and exposure, you know, we set out these various
20 sub-types of beverages, and you can see the list
21 here. We've shown this before. That's the same
22 list that we've had.

1 The comparator is something that I want
2 to highlight, because that does impact on the
3 studies that we review. So for our comparator,
4 we're looking at differences in amount of the same
5 beverage consumed, which could include milk
6 consumption, of a particular beverage, or versions
7 of the beverage diluted with water.

8 We also consider as a comparator a given
9 beverage versus a solid form of that same food,
10 broadly speaking, a given beverage versus water.
11 And then specifically we are looking at
12 sugar-sweetened beverages compared to low- or
13 no-calorie sweetened beverages, and we're looking
14 at dairy milk with different amounts of fat.

15 So this provides the scope, really, of
16 what we're doing. Otherwise, you know, if you just
17 have beverages with no clarity with regard to
18 comparator, you would not be able to go through this
19 in any kind of coherent manner.

20 So then for outcomes for this
21 particular question, we're looking at birth weight
22 that could be presented in a continuous fashion or

1 in categories, small for gestational age or large
2 for gestational age, or birth weight for length.

3 The population then for exposure would
4 be women either before or during pregnancy, and
5 then the outcome is infants at birth. You'll see
6 key confounders here: child sex and gestational
7 age, maternal age, race/ethnicity, SES, and a
8 variety of additional confounders listed there.

9 Other factors that are considered are
10 total energy intake -- that definitely becomes
11 important in a good amount of this work -- and then
12 a variety of other variables related to other
13 components of diet, as well as parity, medications,
14 and supplement use.

15 So for the question here related to
16 beverages during pregnancy and birth weight, these
17 are the numbers of studies. We started out with
18 some 7600, and that got pared down through
19 screening of titles, abstracts and then full text,
20 relative to our criteria, and the articles that
21 emerged then for complete review are 19 in number,
22 to be included in our systematic review.

1 So this is a table that we've shown
2 before, just showing how we're sort of categorizing
3 beverages so that we, you know, can go through this
4 work systematically. What you see highlighted are
5 the types of beverages for which there was a
6 literature available for us to look at.

7 So milk, low- and no-calorie sweetened
8 beverages, sugar-sweetened beverages, coffee and
9 tea, and plain water are the relevant categories.
10 And we'll start here with sugar-sweetened
11 beverages and low- or no-calorie sweetened
12 beverages.

13 Now, for this particular segment of the
14 presentation, our subcommittee opted to provide
15 more detail here than we will subsequently, and the
16 reason that we're doing that is that we wanted to
17 make sure that it was clear to all of you, you know,
18 really what is the way in which we're proceeding
19 with this work?

20 How are we looking at the data? What does this
21 really look like?

22 So we're giving a little bit more

1 specifics here, just for that purpose, of providing
2 that kind of an example.

3 So starting again here, beverages
4 during pregnancy and birth weight, for these
5 exposures there were seven studies, all of which
6 are prospective cohort studies.

7 And in terms of the exposures across
8 those studies, three of them examined
9 sugar-sweetened beverages independently. Two of
10 the studies examined low- or no-calorie sweetened
11 beverages, independently. And then two of them
12 had a combined category of sugar-sweetened
13 beverages and low- and no-calorie sweetened
14 beverages intake.

15 The outcomes included continuous birth
16 weight and categorical small for gestational age
17 and large for gestational age. So this is an
18 example of three studies -- and one of the various
19 types of summary tables that we look at, where you
20 can see, for each study, the sample size, the
21 country where the study was conducted, the exposure
22 and the comparator.

1 For the first study, sugar-sweetened
2 beverage estimated intake in servings per week
3 assessed in the second or third trimester by
4 validated food frequency, representing current
5 intake.

6 And you can see, glancing through here,
7 there is variability across studies in terms of how
8 the exposure was measured, the timing of the
9 measurement as well. And then the outcomes and
10 whether or not the outcome of birth weight was
11 adjusted for gestational age and/or sex or not.

12 I need to take a moment for a glass of
13 water here. Excuse me. Sorry about that.

14 And for these studies, TEI, we're
15 looking for adjustment for total energy intake.
16 You can see the first couple did not address this
17 at all, but the last adjusted, albeit a step-wise
18 process.

19 And then you see participant
20 characteristics here, just to give you sort of a
21 glimpse at, you know, what's considered here.
22 I'm not walking through all this detail. Don't

1 worry. That would be not good.

2 But this just shows sort of a -- some --
3 a couple of reminder of comments about this study,
4 and then the actual results for continuous birth
5 weight and the categorical birth weight, with some
6 color-coding to identify where statistically
7 significant findings were available.

8 Does anyone have a cough drop? That
9 was an actual question.

10 FEMALE VOICE: We have one.

11 (Pause.)

12 MEMBER MAYER-DAVIS: All right. Back
13 to pregnancy and birth weight, looking at
14 sugar-sweetened beverages only, those three
15 studies. So here we found mixed findings, so very
16 mixed findings.

17 So in one study, it was found a greater
18 intake of sugar-sweetened beverages was related to
19 higher birth weight. Another study found the
20 opposite, and then the third study, the
21 relationship was not statistically significant.

22 And none of these particular studies

1 used the same categorical outcome, so there wasn't
2 a way to compare across. This is a view of risk
3 of bias. Many of the presentations have mentioned
4 an evaluation of risk of bias, and there is this
5 specific tool that's used that considers
6 confounding.

7 Confounding is based on the specific
8 key confounders listed in the analytic framework
9 in this case, as I showed at the beginning, and
10 those -- the risk of bias is then classified as low,
11 moderate, serious or critical, and then as well,
12 selection of participants, classification of
13 exposures, deviation from intended exposures,
14 missing data, outcome measurement, selection of
15 the reported result from the paper as a whole, and
16 the most common risk for bias in this particular
17 set, inadequate adjustment for key confounders and
18 inadequate description or definition of the
19 exposures.

20 So then moving towards the literature
21 that focused on low- and no-calorie sweetened
22 beverages or the combination of those, plus

1 sugar-sweetened beverage, two studies examined the
2 low- and no-calorie sweetened beverages
3 independently.

4 One of those studies reported greater
5 intake was related to lower birth weight, and
6 another study relationship was found to be not
7 statistically significant, and neither of those
8 studies examined the categorical birth weight
9 outcomes.

10 There were two studies that combined
11 those categories of beverages, sugar-sweetened and
12 low- and no-calorie sweetened beverages, and for
13 those, one study reported a greater combined intake
14 in relation to lower birth weight.

15 Another study reported greater intake
16 related to higher risk of small for gestational
17 age, and then the third study reporting a
18 relationship between combined intake and small for
19 gestational age that was not statistically
20 significant.

21 So our conclusion then for this
22 particular question is here: insufficient

1 evidence is available to determine the
2 relationship between consumption of
3 sugar-sweetened beverages or low- and no-calorie
4 sweetened beverages during pregnancy and birth
5 weight outcomes, so the grade is not assignable.

6 Moving then to the question of
7 beverages during pregnancy and birth weight,
8 focusing now on dairy milk, there were six studies
9 that assessed dairy milk intake: one RCT and then
10 five prospective cohort studies. And the exposure
11 was commercially available dairy milk of varying
12 fat and sweetener content.

13 The outcomes here were five studies
14 that assessed continuous birth weight and three
15 studies that assessed categorical birth weight
16 outcomes.

17 In terms of findings, four studies
18 found greater milk intake related to higher birth
19 weight. One study found lower milk intake related
20 to higher birth weight. With the outcome of SGA,
21 one study found greater dairy milk intake related
22 to lower risk of SGA. Another study found the

1 relationship to be not statistically significant.

2 A study that looked at large for
3 gestational age did not find a statistically
4 significant association. And then a study that
5 looked at low birth weight, greater milk intake was
6 related to lower risk.

7 The conclusion statement here was that
8 there was insufficient evidence is available to
9 determine the relationship between consumption of
10 dairy milk during pregnancy and birth weight
11 outcomes, with the grade not assignable.

12 And I'll just fill in here a little bit.
13 And I'm not sure on all the details of those studies
14 reviewed, but the risk of bias was considerable
15 across studies, primarily due to concerns with
16 adjustment for key confounders, particularly total
17 energy intake, and also very little evidence or no
18 evidence, and certainly not consistent evidence
19 with regard to dose response. So that's a little
20 bit of, you know, some background that led us to
21 this particular conclusion.

22 Turning then to tea, as the beverage of

1 interest, there were eight studies that assessed
2 tea intake. All of these were prospective cohort
3 studies.

4 Most of the studies combined tea into
5 a single exposure variable, although some looked
6 at some specific types of tea, oolong, black, green
7 tea, and three of the studies specifically looked
8 at caffeinated tea versus tea that is without
9 caffeine.

10 Six of the studies assessed birth
11 weight in a continuous fashion. Eight studies
12 looked at categories of birth weight outcomes.
13 And in terms of findings, three of the studies
14 reported greater intake of tea related to lower
15 birth weight. Three studies showed a relationship
16 with birth weight that was not statistically
17 significant.

18 In terms of SGA, three studies showed
19 a relationship to be not statistically
20 significant, while two studies showed greater tea
21 intake in relation to higher risk of SGA.

22 In terms of low birth weight as an

1 outcome, three studies showed a relationship that
2 was not statistically significant. And for large
3 for gestational age, one study showed highest
4 intake level was related to higher risk for LGA.

5 And so the conclusion here was also
6 insufficient evidence is available to determine
7 the relationship between consumption of tea during
8 pregnancy and birth weight outcomes, grade not
9 assignable.

10 Moving then to coffee. There were
11 seven studies that assessed coffee intake in
12 relation to birth weight, and again, these were all
13 prospective cohort studies. The exposure
14 generally was average coffee intake.

15 Three out of those studies examined
16 caffeinated coffees specifically. Five studies
17 assessed continuous birth weight. Six assessed
18 categorical birth weight outcomes.

19 From three of those studies, greater
20 coffee intake was related to lower birth weight.
21 In two studies, the relationship with birth weight
22 was not significant. For SGA, in two studies,

1 greater coffee intake was associated with higher
2 risk, and in two studies, the relationship was not
3 significant.

4 Low birth weight, similarly, two
5 studies, relationship was not significant. One
6 study, greater coffee intake was associated with
7 higher risk.

8 In terms of our conclusion statement,
9 insufficient evidence is available to determine
10 the relationship between consumption of coffee
11 during pregnancy and birth weight outcomes, grade
12 not assignable for coffee.

13 And again, in terms of risk of bias,
14 there were considerable concerns with regard to
15 adjustment for key confounders, particularly
16 energy intake, and also the difficulty of this
17 issue of, you know, coffee versus caffeine. Now,
18 that may or may not be important, so we
19 just -- there was overall, again, insufficient
20 evidence, grade not assignable.

21 Plain water. Again this is intake
22 during pregnancy with respect to the outcome of

1 birth weight. So there were two studies that
2 assessed plain water intake, both of which were
3 prospective cohort studies. The studies looked at
4 tap and bottled water, and did not include
5 flavored, carbonated or fortified water by way of
6 how the exposure was specified.

7 Outcomes: again, two studies assessed
8 continuous birth weight and two assessed
9 categorical birth weight outcomes. In terms of
10 findings, for two studies, the relationship with
11 birth weight was not significant, and two studies
12 found the relationship to not be significant for
13 the outcomes, categorical of small for gestational
14 age or low birth weight.

15 So again, the conclusion:
16 insufficient evidence is available to determine
17 the relationship between consumption of plain
18 water during pregnancy and birth weight outcomes,
19 grade not assignable.

20 So I've mentioned some of these, but
21 just in summary, across this literature, with
22 regard to beverage consumption during pregnancy

1 and birth weight, there were quite a few of these
2 studies where the attrition was greater than 25
3 percent, which provides a risk of bias in terms of
4 selection.

5 Total energy intake was considered in
6 some studies, but in many studies was not
7 considered. Some of the samples had poor
8 generalizability with respect to lower
9 socioeconomic status and minority populations.

10 In terms of concerns regarding
11 exposure, variation in fat or sweetener levels in
12 these different beverages, that information was
13 generally not available. I mentioned a moment ago
14 that about half of the tea and coffee evidence
15 examined only caffeinated versions or the
16 difference wasn't clear, between the caffeinated
17 and uncaffeinated.

18 There were a lot of issues regarding
19 exposure definitions and assessment methods and
20 timing of the assessment of intake of those
21 beverages during pregnancy.

22 Birth weight -- and I hadn't mentioned

1 this, and should have highlighted this probably a
2 little bit more -- definitely contributed to some
3 of these conclusions. Birth weight was
4 inconsistently adjusted for gestational age and
5 sex, and actually, our original question specified
6 birth weight for gestational age and sex.

7 Many studies adjusted for one but not
8 the other. Some adjusted for neither. Again,
9 inconsistency in the outcomes assessed and
10 definitions used. And for some of the studies
11 where there was a statistically significant
12 result, the effect size, in some cases, was quite
13 small, with the practical and clinical
14 significance of that was unclear.

15 So moving now to alcohol as an exposure.
16 We are working on the question of what is the
17 relationship between alcohol consumption and
18 all-cause mortality? And again, this is via the
19 NESR systematic review process.

20 We do have a new protocol, compared to
21 what we've discussed about before that's posted on
22 DietaryGuidelines.gov. And we'll talk about it

1 here, but it is posted as well.

2 So first, in terms of definition, for
3 this question of all-cause mortality in relation
4 to alcohol consumption, all-cause mortality is
5 defined as the total number of deaths from any and
6 all causes during a specified time period, and this
7 does not include, then, studies of cause-specific
8 mortality; in other words, total number of deaths
9 from a specific cause, CVD, cancer or otherwise.
10 So that's the outcome all-cause mortality.

11 So this is the analytic framework, and
12 this -- you know, the alcohol field is one that has
13 a number of unique characteristics that we really
14 thought through carefully with regard to
15 establishing our analytic framework, and so I
16 wanted to highlight a number of things here.

17 In terms of our intervention and
18 exposure, the primary exposure is average
19 consumption of alcoholic beverages, as well as the
20 pattern of consumption of alcoholic beverages,
21 meaning, for example, number of drinks per drinking
22 day or drinks per drinking occasion.

1 In terms of comparator, the comparator
2 would be different average alcohol consumption or
3 different pattern of alcohol consumption among
4 current drinkers as a primary comparator.

5 A secondary comparator would be intake
6 compared to never drinkers. And you'll notice
7 that former drinkers are not shown here, because
8 there are a whole variety of reasons that people
9 are former drinkers such that that group as a
10 comparator would not be appropriate. So primary
11 and secondary comparators here are important to
12 note.

13 The population, we're focusing
14 primarily on adults 21 years and older, which means
15 that if there are studies that, you know, are
16 primarily adults but happen to include some
17 individuals younger than the drinking age, that's
18 fine, but we're not looking at studies that would
19 be specifically focused on underage drinking.

20 And then outcome -- you know, all-cause
21 mortality, I already discussed, and so this again,
22 primarily, adults, 21 years and older. Now, in

1 terms of key confounders, we're looking at sex,
2 age, race, ethnicity; some markers of SES we
3 consider to be quite important in this work, as well
4 as consideration of eating pattern or diet quality,
5 physical activity, and smoking. These are our key
6 confounders.

7 In addition, as a key confounder for
8 average consumption exposure, pattern of
9 consumption would be considered important. And
10 then on the flip side of that, for pattern of
11 consumption as the exposure, average consumption
12 would be important to consider.

13 In addition, other factors to be
14 considered: total energy intake, ideally without
15 alcohol; and then age distribution of the study
16 sample, anthropometric measurements,
17 hypertension, blood pressure, diabetes, glucose,
18 lipids, medications, as well as family history of
19 chronic disease, and beverage type.

20 So we started with the standard
21 criteria for study design, publication status,
22 language, country, and health status of

1 participants, as we discussed earlier, and a little
2 bit more detail here, again, because of this
3 particular topic of alcohol. I already mentioned
4 the exposure, and so it's important in terms of
5 inclusion criteria that the exposure is that which
6 we've defined.

7 Information on type of beverage will be
8 collected if available, but we don't exclude a
9 study if that's not available; it's just good if
10 we can have it.

11 And again, in terms of exclusion
12 criteria, data on non-drinker groups, where never
13 and former are combined, say, in an observational
14 study, would actually be excluded, just because of
15 the potential problems and bias with combining and
16 including the former drinker group along with the
17 never drinker group.

18 So the never drinker group is a
19 secondary comparator, but a study would be excluded
20 if the study includes former drinkers. And the
21 comparator, I've already focused on that, so don't
22 need to repeat that.

1 And again, in terms of exclusion
2 criteria with regard to the comparator, again, the
3 former drinker issue needs to be considered, and
4 that would be excluded if there was a study where
5 the comparison with never and former drinkers was
6 combined.

7 In terms of the dates here, we include
8 studies from January 2000 to now, January 2020, and
9 exclude articles published prior to January 2000,
10 and again, I already mentioned about the age of
11 participants.

12 So we saw from a couple of the earlier
13 examples for this particular subcommittee, the
14 numbers of studies is very high, and so we, you
15 know, have had to really think about prioritizing
16 our remaining work, and what we're doing is, with
17 regard to added sugars and health outcomes for
18 cardiovascular disease, we are approaching that,
19 building on the 2015 NESR systematic review.

20 In terms of type 2 diabetes, we'll be
21 building on the 2015 Advisory Committee report, as
22 well as for growth, size, body composition and risk

1 of overweight and obesity, and building on the
2 2015.

3 For alcohol and health outcomes, we are
4 prioritizing all-cause mortality as the first
5 outcome to be examined. I just discussed about
6 that work underway, and as time allows, we will move
7 then to address as outcomes CVD, cancer,
8 neurocognitive health, as well as growth, size, and
9 body composition.

10 So that's where we are. Again,
11 thanking the members of the subcommittee, as well
12 as the support staff, doing wonderful work.

13 Okay. So questions?

14 CHAIR SCHNEEMAN: Thank you.

15 (Applause.)

16 CHAIR SCHNEEMAN: So questions for the
17 subcommittee? Ron?

18 VICE CHAIR KLEINMAN: That was a great
19 presentation. This is a minor comment, and you
20 alluded to it. It has to do with the outcome of
21 birth weight, and I think you mentioned the small
22 effect size and whether these are biologically

1 significant so I wonder if it's worth just noting
2 that when you say higher birth weight studies,
3 either in parentheses or something, within normal
4 reference weight values or something to indicate,
5 these are still normal children.

6 (Off-mic comments.)

7 MEMBER MAYER-DAVIS: Correct, and that
8 is the case. So yes, that's a good comment. So
9 in the report, it will be important to provide that
10 framework. Yeah. Thank you for that. Yeah.

11 MEMBER DEWEY: Kay Dewey. With regard
12 to the dairy milk and birth weight analyses, one
13 of them was, I think, one of the five studies for
14 birth weight showed a positive relationship, and
15 one didn't.

16 I was wondering what the sample sizes
17 were for all those studies, and I know that you gave
18 the conclusion statement as insufficient evidence.
19 I'm just curious about the choice between limited
20 and insufficient, and knowing in our subcommittee
21 when most of the studies are going in a certain
22 direction, we might have chosen limited. And this

1 one seems to be a case where that might be the
2 situation. I know you mentioned some important
3 limitations in -- but one that you mentioned was
4 adjusting for total intake.

5 And I feel that that's one that is one
6 of those gray areas, because it could be on the
7 causal pathway. So it's a little bit different
8 than a regular comparator. And so I wondered if
9 you could speak to that and the differing
10 conclusion.

11 MEMBER MAYER-DAVIS: Yeah, yeah. So
12 that -- first of all, it was the case that for those
13 four studies, there were concerns in terms of risk
14 of bias and accounting for key confounders was one
15 of the primary concern.

16 Total energy intake was a concern, and
17 you know, the role of total energy in this kind of
18 situation is always a question. Whether you
19 consider that to be part of a causal pathway or not
20 could be debated probably for hours.

21 So I appreciate that concern. One of
22 the problems with that literature also had to do

1 with dose response. So for example, I'm recalling
2 now, although the NESR people will recall better,
3 but I recall now, at least one of the studies where
4 there was a significant effect -- there was no
5 evidence for dose response.

6 So there were quartiles, so any
7 quartile compared to the first, once you got to the
8 second quartile, that was it; flat thereafter.
9 So that's just an example of one of the several
10 problems across that literature.

11 But I appreciate that, and one of the
12 reasons that I could answer the question with that
13 level of detail in terms of that one study is
14 because I looked at that myself, and again, I said,
15 now, let me make sure I remember why we made that
16 decision.

17 So that was a great comment. And I'm
18 looking over here at Brittany, and I don't know if
19 you want to add to that. That would be helpful,
20 too.

21 MS. KINGSHIPP: Sure. Brittany
22 Kingshipp. So I was also just glancing at the milk

1 literature, the sample size question, and it ranges
2 from the mid 100s up to about 3,000 depending on
3 what cohort they were looking at.

4 And so there were concerns about the
5 things Beth has noted. Also, as was noted, kind
6 across this body of evidence. That body of
7 evidence in particular had multiple studies with
8 very attrition rates, and so that, combined with
9 inconsistency in whether birth weight was adjusted
10 for gestational age and sex or not, half the studies
11 did, half did not.

12 The same was true for total energy
13 intake. So what we did is look at total energy
14 intake kind of beyond the scale of a regular
15 confounder, so that we were interested, if they did
16 adjust for it, that's answering one question. If
17 they did not, that's answering another question,
18 both of which we are interested in.

19 And so it wasn't necessarily that they
20 got penalized if they did not. They just got
21 treated differently in interpreting findings, and
22 so because that was also done inconsistently in

1 that body of evidence, all of those inconsistencies
2 kind of snowballed to the point that no clear, even
3 limited, conclusion can be drawn.

4 MEMBER MAYER-DAVIS: Any other
5 questions?

6 (No response.)

7 CHAIR SCHNEEMAN: Okay. Seeing none,
8 I suggest we take a break right now.

9 (A short recess was taken.)

10 CHAIR SCHNEEMAN: So we're now ready
11 for our last subcommittee report of the day. Is
12 it -- no, it's working now. So -- and that will
13 be the Data Analysis and Food Pattern Modeling, the
14 Cross-Cutting Working Group.

15 And so Dr. Regan Bailey will be giving
16 that subcommittee report.

17 MEMBER BAILEY: It's my great pleasure
18 to do so and represent the people on the committee
19 and Jamy Ard, Jamie Stang, Tim Naimi, and Teresa
20 Davis, and supported by Dr. TusaRebecca Pannucci.

21 Wow, I look tired. It's a very strange
22 thing to see your face that big. So today we will

1 be presenting very summary types of statements,
2 draft conclusions of summaries of so much data.

3 So in your Committees, I'm hearing a
4 constant theme of we have insufficient evidence.
5 Subcommittee seven has nothing but evidence. We
6 have so much data. And we can't -- we will share
7 it all with you in the report, but what I'd like
8 to attempt to do is to show you some of the
9 highlights, the top-level kind of findings today,
10 and where we're thinking.

11 So you'll see those. And then the
12 remaining work we have to do is, we have to work
13 within our committee with the B-24, as well as the
14 Pregnancy and Lactation committee, to refine some
15 of those questions as they relate to food and
16 nutrient intakes and nutrients of public health
17 concern.

18 And then the last part, of course, our
19 subcommittee is responsible for the food pattern
20 modeling that will be informed by the evidence that
21 we all have from your committees.

22 So today, we will focus primarily on

1 Americans two years and older. So infants and
2 toddlers, the B-24, and pregnant and lactating
3 women aren't going to be the focus of the data I'm
4 presenting today.

5 So all of the data that we will be
6 talking about, we have as age groups, by sex, by
7 race/ ethnicity, and socioeconomic status, and
8 again, I can't show you all those, but I'm going
9 to give you some high-level takeaways.

10 And just a reminder of the analytic
11 framework. So we're using for the dietary
12 intakes, the NHANES What We Eat in America. At
13 this point, the data I'm presenting today are just
14 from foods and beverages, so the nutrient intake
15 data are not inclusive of dietary supplements at
16 this point.

17 We're presenting data on chronic
18 diseases from these sources, and again, this is all
19 posted online, and we've gone over it, but just to
20 have it fresh in your mind.

21 So the first question that we will be
22 presenting evidence on is to describe and evaluate

1 current intakes of food groups and nutrients. And
2 so we'll go through these at a pretty high level.

3 So for fruit, the top contributors to
4 fruit are whole fruit, 100 percent fruit juice, and
5 sweetened beverages. And then in bold, I have the
6 intakes, the mean or average intakes for Americans
7 two and older, so about one cup-equivalent per day
8 of fruit.

9 For vegetables, vegetables are
10 primarily being consumed as part of burgers and
11 sandwiches and mixed dishes. So less than
12 50 percent of the vegetables that are being
13 consumed are discrete vegetables.

14 And if there's one thing you're going
15 to hear me say today, again, over and over, is
16 burgers and sandwiches. Okay? So that's
17 something that really will come through in this
18 data, and that is kind of reflective of the American
19 dietary pattern.

20 Dairy: So most of dairy intake, about
21 one and a half cups per day on average coming from
22 fluid milk and cheese. Fluid milk intake

1 decreases with age, and over time, since 2007-08,
2 total dairy intake has decreased in the United
3 States.

4 Whole grains is coming primarily
5 through breakfast cereals and bars. So we have
6 seen increases in whole grain intake across time,
7 but only 2 percent of Americans are currently
8 meeting whole grain recommendations.

9 And then protein foods, primarily
10 coming from animal-based sources. In general,
11 it's adequate for most Americans, except for
12 females ages 12 to 19 and 70 years and older, with
13 about 5.8 ounce-equivalents per day.

14 The majority of the American population
15 for all groups examined are exceeding recommended
16 energy intake from solid fats and added sugars.
17 The main source of solid fats is burgers and
18 sandwiches, desserts and sweet snacks.

19 And then in children less than 11 years
20 of age, high-fat dairy is also a significant source
21 of solid fat. So the main source of added sugar
22 is sweetened beverages, desserts and sweets and

1 snacks, and coffee and tea.

2 And so I use the ampersand to keep food
3 groups together. I don't generally like the
4 ampersand, but just for clarity. So burgers and
5 sandwiches together, desserts and sweet snacks
6 together, coffee and tea together.

7 So our draft conclusion statement is
8 that for Americans ages two and older, intakes of
9 fruits, vegetables, dairy and whole grains are
10 generally below recommended amounts and have not
11 changed over time. Intake of total grains and
12 total protein generally meet recommended amounts.
13 Okay.

14 For ages one and older -- because the
15 food group, we're looking at compliance with
16 previous dietary guidelines. When we're looking
17 at nutrients, we're looking at one and older,
18 because the dietary reference intake age groupings
19 are one to three. So sometimes you'll see
20 two-plus, one-plus, so just for some clarity there.

21 So 9 percent of children and 58 percent
22 of males, 67 percent of females have carbohydrate

1 intakes within the AMDR. Across all age groups,
2 protein intake is within the AMDR.

3 Protein also has an EAR, and I mentioned
4 that older adults and teenaged females have intakes
5 that are below the EAR. So the proportion of the
6 population with fat within the AMDR is about 60
7 percent for children and 50 percent for adults, and
8 for all ages, sodium, saturated fats and added
9 sugars are overconsumed.

10 In terms of nutrients that are
11 underconsumed, we have several, including vitamins
12 A, C, D, E, K, calcium, magnesium, fiber, choline,
13 and potassium. In addition to those, other
14 population groups have nutrients or food
15 components that are underconsumed.

16 And so we're going to focus on these a
17 little bit more when we do the last question,
18 question 5, on nutrients of public health concerns.
19 So keep these in your mind. We're going to come
20 back to them.

21 And then in young children, retinol,
22 zinc, copper and selenium are overconsumed,

1 relative to the upper level.

2 So moving on to dietary patterns and
3 beverage consumption, just a reminder of the
4 analytic framework.

5 At this point, we have the average HEI,
6 total and component scores, but we are awaiting the
7 distribution of those scores. We'll be looking at
8 that, as well as food category contributions to
9 total energy intake.

10 And so where we're talking about
11 dietary patterns, just a reminder that we don't
12 have self-reported patterns of intake. So we're
13 looking at reported intakes relative to the HEI,
14 not necessarily able to categorize patterns as
15 vegetarian or Mediterranean. Okay?

16 So for children and adults, we will look
17 at beverage intake data in the following ways, and
18 we've talked about this, by the population groups,
19 mean intakes, and the percent of energy and
20 nutrients coming from beverages, as well as
21 calories.

22 Just a reminder of the definitions of

1 the beverage categories that we'll be talking about
2 today. We've seen these before. Okay. We've
3 seen this slide before. Out of 100 points, the
4 American diet is currently at a score of 59.

5 And what's encouraging is that it has
6 increased slightly over the last decade, from 56
7 to 59. And we do see age differences. So young
8 children, two to five, and adults over the age of
9 65 tend to have higher scores than all other age
10 groups.

11 So this might look complicated, but
12 let's walk through it. So all of the ways that the
13 100 points are divided are around the edge of this
14 spider web here. So if you start with total fruits
15 and start going clockwise, you get higher points
16 for more compliance, whereas if you went
17 counterclockwise from total fruits, lower intakes
18 are associated with a higher point score.

19 So in an ideal spider web -- I don't
20 know what these are actually called, but -- and
21 what is called?

22 MALE VOICE: Radar plot.

1 MEMBER BAILEY: Radar plot. Okay.
2 In an ideal radar plot, you would have the
3 whole -- if you had a score of 100, it would be all
4 around the outside. So in this slide, we can see
5 some differences among race/ethnic groups.

6 So non-Hispanic Asians have the highest
7 HEI score, and those are represented with the color
8 red on the radar plot. And you'll see differences
9 and -- within certain food categories. For
10 example, look at greens and beans, how more
11 compliant that race/ethnic group is with the
12 recommendations. Non-Hispanic blacks have the
13 lowest HEI score relative to the other groups.

14 So our draft conclusion one from some
15 of that data is that, while average diet quality
16 has slightly improved, scores are not necessarily
17 consistent with the current recommendations, and
18 we do see differences with sex, age, race,
19 ethnicity and income, but the differences are
20 generally small.

21 This is where the food categories that
22 are contributing to energy. And the -- I'm just

1 going to take a second to walk through these,
2 because I know we've looked at them before, but just
3 to remind you.

4 So the first bar is for all Americans
5 two and older. All the different colors represent
6 the top 10 food categories. And one thing that is
7 surprisingly consistent is those food categories
8 do not change. What changes is the proportion by
9 age group.

10 So these are food category sources.
11 You can see that for children two to five, there
12 is less proportion from burgers and sandwiches
13 than, say, in adulthood.

14 And we'll come back and look at some of
15 those when we look at how patterns track across
16 life, but just to give you a sense of food category
17 source of energy for this context right now.

18 So our second draft conclusion is that
19 foods and beverages consumed via mixed dishes, such
20 as sandwiches, casseroles and pizza, sweets and
21 snacks, and beverages, contribute about 50 to 60
22 percent of total energy intake.

1 Food subcategory source contributions
2 to energy vary by all of the population
3 demographics that we've talked about, but for the
4 total population, about five subcategories make up
5 most of the energy, and that's burgers and
6 sandwiches, desserts and sweet snacks, rice, pasta
7 and grain-based mixed dishes, sweetened beverages,
8 and chips, crackers and savory snacks.

9 So this is looking at where beverages
10 are contributing to energy intakes. So in
11 general, about 15 percent of energy comes from
12 beverages, and this is specifically among two- to
13 19-year-olds.

14 So beverages contribute about
15 40 percent or more of added sugar in two- to
16 19-year-olds. The percent of added sugar from
17 beverages significantly increases with age, and so
18 when milk is decreasing, it tends to be replaced
19 with sweetened beverages.

20 But all is not lost in the beverage
21 category, for 40 percent of vitamin C and D and more
22 than 20 percent of carbohydrates, calcium,

1 potassium, and magnesium are coming from
2 beverages, mainly milk and 100 percent fruit juice.

3 And not surprisingly, more than
4 80 percent of caffeine comes from beverages. This
5 is looking at adults. So this is a pie chart
6 showing, of all the beverages' calories, what
7 specific foods they are coming from.

8 And the three top sources are sweetened
9 beverages, alcohol, and coffee and tea. And
10 what's interesting here is there are sex
11 differences. So males have more energy intake in
12 terms of beverage calories from alcohol, whereas
13 women are more likely to have coffee and tea
14 calories, which brings me to conclusion number
15 three.

16 Calories from total beverage account to
17 15 to 18 percent of total energy for Americans.
18 Fluid milk as a beverage decreases, starting in
19 early childhood, and intake of sweetened beverages
20 increases.

21 And beverages account for 40 to
22 50 percent of added sugars in the diet, and

1 alcoholic beverages contribute 21 among females
2 and 31 percent among males of total beverage
3 calories.

4 We are probably only about 20 percent
5 of the way through my slides. So I just wanted to
6 give you, like, some context. Just take a deep
7 breath. We're going to do this.

8 Okay. So this question asks about how
9 patterns track across life stages, and ideally, to
10 answer this type of question we'd have longitudinal
11 data.

12 What we have is cross-sectional data,
13 so we can look at different age groups and try to
14 get some trends and some patterns, but we can't
15 necessarily say how they track within an individual
16 or within populations or subgroups.

17 So we will use this analytic framework,
18 again looking at food category source, means,
19 beverage contributions, as well as HEI scores,
20 across different life stages for two and above.

21 This radar plot shows you how diet
22 quality and different components of the HEI changes

1 by age. So remember, I said the youngest children
2 and older adults have the highest diet quality.

3 When we put the two- and 19-year-olds
4 together, in blue, that kind of changes the story
5 a little bit, but nevertheless, you can see that
6 older adults have a higher HEI score in what foods
7 are represented in the diets of older adults:
8 things like total vegetables, greens, beans,
9 seafood and plant proteins, as well as fruit,
10 refined grains, and lower added sugars, as we
11 talked about before.

12 So once children begin to age, their
13 milk intake goes down, and so do scores in the dairy
14 component. You can see that clearly from this
15 plot.

16 So this is going to be the start of a
17 marathon of slides that look exactly like this, but
18 the title is going to change. And the colors are
19 not always consistent. So if you want me to stop
20 and you want to look at them in a little bit more
21 detail, our safe word in our subcommittee is
22 tangerine.

1 So if you want me to stop, just say,
2 tangerine, and I'll know it's time to stop. Okay.
3 So this is looking at energy. You've already seen
4 this one, so we won't spend too much time here.

5 But next, looking at vegetables, and
6 how those change with different age groups. So the
7 green is represented by vegetables, including
8 beans and peas that are not starchy. As I
9 mentioned earlier, less than 50 percent of
10 vegetables are consumed as a vegetable alone.

11 Chips, crackers, and savory snacks and
12 pizza are a larger source of vegetables for
13 children than for adults or older adults. And mean
14 vegetable intakes tend to increase with age.

15 Looking at fruit, you can see, as I told
16 you earlier, that primarily coming from, you know,
17 whole fruit, but it does decrease after the age of
18 five, and then pretty much levels off and stays
19 about the same after the age of five.
20 And 100 percent fruit juice decreases after
21 adolescence.

22 This is looking at whole grain intake,

1 and we talked about the mean intake earlier, but
2 chips, crackers, and savory snacks as a source of
3 whole grains decreases, and yeast bread and
4 tortillas increases as a source of whole grains
5 among individuals in older age groups.

6 So you can just see some of the
7 patterns. The number-one contributors generally
8 stay the same, but the proportions change with
9 different age groups.

10 So going on to dairy, there is a food
11 category source shift from higher fat among young
12 children to burgers and sandwiches among young and
13 middle-aged adults, and older adults, desserts and
14 sweets and snacks are really a large contributing
15 source to dairy.

16 This is looking at protein foods. So
17 mean total protein is generally within recommended
18 ranges. We talked about those groups that it's
19 not. For older children and younger adults,
20 burgers and sandwiches is the main category source,
21 and mixed dishes contribute a smaller proportion
22 of protein to the intakes of older adults.

1 Looking at added sugars, mean added
2 sugar intake is highest in adolescence and early
3 adulthood. The food category sources here change
4 across the life course. So desserts and sweet
5 snacks are a large contributor for both young
6 children and older adults, whereas in between those
7 age groups, it's really sweetened beverages, so
8 from six to 50.

9 And for adults, coffee and tea are also
10 a source of added sugar. These are -- coffee and
11 tea are not naturally contained in this, so this
12 inclusive of the additions. I should have made
13 that point earlier.

14 This is looking at calcium. The slide
15 is set up in just the same way. So high-fat milk
16 and yogurt is the largest contributor among young
17 children, and it shifts to burgers and sandwiches
18 for adolescents and adults. And water makes up a
19 large contributor among adults to calcium intakes.

20 This is looking at potassium, so milk
21 and yogurt is a large contributor for young
22 children, and that shifts to --

1 VOICE: burgers and sandwiches.

2 MEMBER BAILEY: -- burgers and
3 sandwiches. Thank you. Somebody's awake. All
4 right. And then coffee and tea and vegetables in
5 adulthood, as a large contributor.

6 This is looking at sodium, and as we
7 mentioned earlier, it's overconsumed across all
8 life stages, and this is primarily coming from
9 burgers and sandwiches, and that's pretty
10 consistent across most age groups.

11 This is looking at vitamin D. And
12 remember, I'm only showing you the highlight reel.
13 Okay? So you can imagine how much data we've been
14 looking at.

15 So vitamin D is underconsumed across
16 all life stages. Again, children are getting
17 vitamin D, similarly to calcium, from high-fat,
18 low-fat dairy and milk, and in adults, it's burgers
19 and sandwiches.

20 So this is our draft conclusion
21 statement. There is general consistencies in diet
22 quality seen across life stages. Diet quality is

1 better among young children and older adults, but
2 even so, it still does not align with existing
3 guidance.

4 Food category sources of food groups
5 and nutrients differ across life stages. In
6 particular, in the case of milk and yogurt, after
7 early childhood decrease, and intakes of added
8 sugar from beverages increase.

9 Fruit and vegetable intake declines
10 through adolescence and adulthood, and then
11 increases among older adults. Intakes of burgers
12 and sandwiches contribute to most food groups,
13 nutrients and food components which fall outside
14 of recommended ranges.

15 So burgers and sandwiches help
16 contribute to underconsumed nutrients, because
17 they're so ubiquitously consumed, but they also,
18 at the same time, contribute to those nutrients and
19 food components that we want to limit, such as
20 sodium and saturated fat.

21 Deep breath. Okay. So for the
22 prevalence of nutrition-related chronic

1 conditions, we have, as I mentioned earlier,
2 several data sources. What I'm going to do here
3 is a word that I learned yesterday called bookend.

4 So I'm going to tell you the conclusion,
5 and then I'm going to show you the data, and then
6 we'll revisit the conclusion as a group to get some
7 input, because there is a lot of information I'm
8 going to give to you, and distilling it into a
9 couple of sentences is very complicated. So we'd
10 really love to hear the Committee's feedback on
11 what you think are the most salient points to
12 include in this section.

13 So we are looking at this with a life
14 stage approach, and the colors are simply there to
15 show you that there are certain things, like body
16 composition, that we will looking at in most age
17 groups, cardiovascular endpoints. So we'll start
18 with young children.

19 We only have two outcomes in young
20 children. We have body composition. So more U.S.
21 children under the age of 24 months are overweight,
22 about 9 percent, than underweight, based on weight

1 for recumbent length.

2 The prevalence of low birth weight and
3 very low birth weight are 8.3 and 1.4 percent
4 respectively. Non-Hispanic black mothers have
5 the highest prevalence of low birth weight babies,
6 and this has increased over time.

7 We have a different age group for
8 allergies. So based on proxy report, the
9 prevalence of food allergy is 6.6 percent. So this
10 is not clinically confirmed data. It's -- I felt
11 strange using the word self-report, because it was
12 birth to four.

13 And I'm just imagining like a little
14 baby trying to tell you -- anyway. So proxy
15 report. So you know, there's obvious limitations
16 with that kind of data; it's not clinically
17 confirmed.

18 So looking at the data that we have
19 available in children in the following categories,
20 the prevalence of overweight is about 17 percent,
21 obesity, 18.5 percent, and underweight, 3 percent.

22 Prevalence of underweight is higher in

1 boys than girls and increases with age. However,
2 the prevalence of underweight has decreased over
3 time. The prevalence of obesity is higher in boys
4 than girls. It increases with age, and has
5 increased since 2007 and 2008.

6 Among girls, the race/ethnic group with
7 the highest prevalence of obesity is non-Hispanic
8 black, whereas among boys, highest prevalence is
9 in Hispanic and Mexican-Americans.

10 The prevalence of obesity is lowest
11 among children whose head of household has a
12 college degree or higher.

13 So our draft conclusions for CVD
14 intermediate outcomes: the prevalence of
15 hypertension is 4 percent, and it's higher in
16 males, non-Hispanic blacks, 18- to 19-year-olds,
17 and those with obesity relative to their peer
18 counterparts.

19 Prevalence of high LDL is 5 percent, and
20 prevalence of low HDL is 15.5 percent. The
21 prevalence of high LDL is higher in non-Hispanic
22 whites, and Hispanic and Mexican-Americans -- you

1 can see the percentages there -- when compared with
2 non-Hispanic black and Asian youth.

3 The prevalence of low HDL cholesterol
4 is higher in males, non-Hispanic whites and youths
5 with obesity. So for each chronic health
6 condition we've examined in children, the highest
7 prevalence is among those with obesity.

8 We have one cancer outcome, and that is
9 leukemia, and you can see the incidence and
10 mortality rate, both of which are higher among boys
11 than girls, and so this is inclusive of birth to
12 19 years of age, from the SEER data.

13 In terms of diabetes and prediabetes,
14 we have data on 12- to 19-year-olds, and the
15 prevalence of those combined is 23 percent. This
16 is coming from NHANES data.

17 Dental caries: So first, looking at
18 two- to 19-year-olds, the prevalence is about
19 46 percent, and then untreated dental caries is
20 about 13 percent, so this tends to be associated
21 with age.

22 Again, this is cross-sectional data, so

1 we can't say the prevalence of caries increases
2 with age, but the age groups and the prevalence
3 track in the same way.

4 Hispanic youths have the highest
5 prevalence of dental caries, but non-Hispanic
6 blacks have the highest prevalence of untreated
7 dental caries. The prevalence of both caries and
8 untreated caries is lower among families with a
9 higher income. And there has been a slight
10 downward trend over time for the prevalence of
11 total and untreated dental caries.

12 Moving on to adults, the overall
13 prevalence of underweight among adults is 1.5
14 percent. The prevalence of overweight and obesity
15 and severe obesity are highlighted there in
16 parentheses. The prevalence of overweight has
17 decreased, while the prevalence of obesity and
18 severe obesity has increased.

19 And the prevalence of obesity and
20 severe obesity is higher in women than it is in men.
21 Mean body weight, weight circumference, and BMI
22 have increased over time.

1 Adults 40 to 59 have the highest
2 prevalence of obesity. Hispanic and
3 Mexican-Americans have the highest prevalence
4 among men, and among women, it's non-Hispanic black
5 women.

6 Looking at the data, the overall
7 prevalence of dental caries among adults age 20 to
8 64 is 90 percent, and 96 percent among adults ages
9 65 and older.

10 Women have a slightly higher prevalence
11 than men among 20- to 64-year-olds, but the
12 prevalence converges after the age of 65.
13 Non-Hispanic blacks have the highest prevalence of
14 untreated dental caries, and the overall
15 prevalence of complete tooth loss is 2 percent in
16 20 to 64, but increases to 17 percent among those
17 age 65 and older.

18 So looking at cardiovascular,
19 intermediate and outcomes, high cholesterol among
20 adults is 12 percent. Low HDL, 18 percent.
21 Hypertension, 29 percent. Coronary heart
22 disease, 6 percent, and stroke, around 3 percent.

1 So when we talk about adults in general,
2 we're talking about 19 and older, but some of the
3 data come from different surveys, so that is why
4 we have 18 and 19 for some of these age groups here.

5 The prevalence of high cholesterol and
6 low HDL has decreased since 2007-08. Women have
7 a higher prevalence of high cholesterol. Men have
8 a higher prevalence of hypertension, low HDL, CHD
9 and stroke.

10 Adults 40 to 59 have the highest
11 prevalence of total cholesterol and low HDL.
12 However, adults ages 65 and older have the highest
13 prevalence of hypertension, CHD and stroke.

14 So some more key findings here.
15 Non-Hispanic whites have the highest prevalence of
16 high cholesterol among women. However, Hispanics
17 have the highest prevalence of high total
18 cholesterol among men.

19 Hispanics have the highest prevalence
20 of low HDL for both men and women. Non-Hispanic
21 blacks have the highest prevalence of hypertension
22 and stroke. American Indian and Alaska Natives

1 have the highest prevalence of coronary heart
2 disease.

3 The prevalence of hypertension,
4 coronary heart disease and stroke are lower among
5 those with higher education levels, and those with
6 a college degree tend to have the lowest prevalence
7 of these cardiovascular outcomes.

8 In terms of diabetes and metabolic
9 syndrome, diabetes is prevalent in about 14 percent
10 of U.S. adults; prediabetes, 34 percent; and
11 metabolic syndrome, almost 35 percent.

12 So men have a higher prevalence of
13 diabetes and prediabetes, but there's no
14 differences for metabolic syndrome. So the
15 prevalence of diabetes and metabolic syndrome is
16 higher among older age groups.

17 In fact, 52 percent of older adults have
18 metabolic syndrome. The prevalence of diabetes is
19 higher among those with higher BMIs, and Hispanics
20 and Mexican-Americans have the highest prevalence
21 of diabetes and metabolic syndrome.

22 In terms of chronic liver disease, we

1 have two different measures. First is
2 self-report, which is about 2 percent, but then
3 looking at ALT and AST, ALT is elevated in about
4 10 percent, and AST in 16 percent of U.S. adults.

5 Hispanics have a higher prevalence of
6 liver disease, high ALT and high AST, when compared
7 with non-Hispanics. American Indian and Alaska
8 Natives have the highest prevalence of liver
9 disease.

10 Men and women have the same prevalence,
11 and mortality rates differ. So men have a higher
12 mortality rate than women. And mortality rates
13 have increased over time, particularly in men.
14 And then men age 55 to 64 have the highest mortality
15 rate from chronic liver disease.

16 So these are a different data source.
17 So this is from the National Vital Statistics
18 System. These are the age-adjusted prevalence
19 rates for chronic liver disease and cirrhosis, and
20 you can see that they have increased since 2006 to
21 2016 in every age group, except for males 45 to 54.
22 And men 55 to 64 have the highest mortality rate

1 from chronic liver disease, and the lowest rate is
2 among females 25 to 34.

3 Moving on to cancer, so the cancer with
4 the highest incidence rate among females is breast
5 cancer, followed by male prostate cancer.

6 Age group and cancer type with the
7 highest incidence rate is prostate cancer for men
8 among ages 65 and older. Mortality rate is highest
9 for lung and bronchus cancer, and the age group is
10 the highest mortality rate from that cancer is
11 among older adults, 65 and older.

12 Men have a higher incidence and
13 mortality rates than women across all shared cancer
14 types, and the incidence and mortality rates for
15 every cancer type are highest among individuals 65
16 and older.

17 So we'll talk last in this section about
18 pregnant women. We're just going to talk about
19 gestational diabetes today, because the 2018
20 pregnancy-induced hypertension data is just coming
21 into our emails now, so we'll hold off on that until
22 next time, and just focus on gestational diabetes

1 right now.

2 Total prevalence, about 6 percent. It
3 is higher in women who are older than 40. There's
4 some race/ethnic differences. So non-Hispanic
5 Asians, 11 percent have gestational diabetes.
6 Also very high in American Indian and Alaska
7 Natives and Native Hawaiians and Pacific
8 Islanders.

9 The prevalence remains relatively
10 stable across educational status, but among those
11 with obesity, particularly Class III obesity, the
12 prevalence is 14 percent.

13 So older adults, we have two outcomes
14 here, muscle strength and osteoporosis and bone
15 health. So 19 percent of older adults have reduced
16 muscle strength. This is data coming from NHANES.

17 And there's really an increase with
18 age. So 48.6 percent of adults over the age of 80
19 have reduced muscle strength. So the age-adjusted
20 prevalence is not different between men and women.
21 It's about 19 percent, and similarly, women who are
22 older than 80, it's slightly higher in women than

1 men, but not substantially different, so 49 versus
2 47.

3 Non-Hispanic Asians have the highest
4 age-adjusted prevalence rate, followed by
5 Hispanics, and then Non-Hispanic blacks have a
6 prevalence that is about 19 percent, and
7 non-Hispanic whites, about 18 percent.

8 In terms of osteoporosis, it's
9 estimated that about 11 percent of adults over the
10 age of 50 have osteoporosis, and about 45 percent
11 have low bone mass, and as we know, women are
12 disproportionately affected by both osteoporosis
13 and low bone mass, and that's amplified here in the
14 last bullet point.

15 So again, given all of the complexity
16 of the data that we showed you, it was very hard
17 to come to a conclusion statement. So this is a
18 work in progress, and we really want it to be
19 informed by you.

20 But we kind of started with this large
21 umbrella, to try to be inclusive of all the things
22 that we found, but we'd like to drill down and have

1 some more specific conclusions. Okay.

2 We are on the last question. Evaluate
3 nutrients of public health concern. So we've
4 talked a lot about intakes of food groups,
5 short/long nutrients, and this will be our last
6 question.

7 So with nutrients of public health
8 concern, we have tried to use the terminology food
9 component, because there's things that we're
10 talking about that aren't essentially nutrients.

11 So if you are confused, that is why.
12 The question was written for nutrients, but we are
13 trying to use food components. So we developed
14 this flowchart ahead of time. That's where we
15 looked at the data to make decisions.

16 So sometimes we had dietary data available.
17 Sometimes we have biomarkers. Sometimes we have
18 clinical outcomes.

19 So we had a decision tree in place
20 before we looked at the data to try to be as
21 transparent as possible. And I don't expect you
22 to read that, because it's very small. It will be

1 in the report.

2 So we first started by casting a wide
3 net. We defined underconsumed or overconsumed
4 when a food component was not within the range of
5 5 percent or higher relative to a dietary reference
6 intake or a quantitative authoritative
7 recommendation, such as a previous dietary
8 guideline recommendation for saturated fat.

9 Similarly, for overconsumed. Then
10 those are elevated to a nutrient or food component
11 of potential public health concern when supporting
12 data through biomarkers, functional indicators,
13 that these low intakes or high intakes are directly
14 related to a health condition.

15 Then we are proposing this category
16 called nutrient or food component that poses
17 special challenges. This is a term that was used
18 by the 2005 Committee to identify food components
19 for which dietary guidelines to meet
20 recommendations was challenging.

21 But we've extended this to also include
22 nutrients or food components that pose special

1 challenges in identifying at-risk groups. And
2 I'll show you what I mean on the next couple of
3 slides.

4 So casting our wide net of 5 percent for
5 underconsumed nutrients, there were a number of
6 nutrients that were either in the population or in
7 specific subgroups, noted with an asterisk, that
8 were not well aligned with recommendation, either
9 the EAR or the AI.

10 So when we next evaluated whether there
11 was a biomarker or clinical endpoint that we could
12 tie low intakes to, we were able to eliminate
13 several nutrients, and those that are listed in
14 bold have previously been linked to a health
15 outcome or biomarker, whereas we still have a few
16 that are listed there in red that are special
17 challenges.

18 In terms of overconsumption, we've
19 already talked about sodium, saturated fat and
20 added sugars, but compared to the UL, young
21 children are exceeding the UL for retinol, zinc,
22 selenium and copper, and you can see those

1 prevalence estimates in the parenthesis there,
2 ranging from about 6 percent for copper to
3 50 percent for zinc and selenium.

4 So then we come to these food components
5 that pose special challenges, and this is where we
6 can also use some of the Committee feedback and
7 guidance. So I mentioned that protein was
8 underconsumed in adolescent and older females.

9 Vitamin B12 might be a concern in older
10 adults, both dietary data and biomarker. Choline
11 intakes are low relative to the AI for most age/sex
12 groups, after young children. Phosphorus intake
13 is low in 9 to 14-year-olds, as well as magnesium.

14 So magnesium is low, relative to the
15 EAR, across most age groups. So our analytic
16 summary so far is that nutrient intakes have not
17 changed considerably since the evaluation.
18 Nutrient intake distributions taken into
19 consideration with biological endpoints and
20 clinical outcomes suggest that vitamin D, calcium,
21 fiber and potassium are underconsumed.

22 Sodium, saturated fat and added sugars

1 are overconsumed for all Americans ages one and
2 older. We're still talking, and that's why we
3 brought this to you today, in terms of the
4 distinction of what is a nutrient of public health
5 concern for some of those remaining nutrients?

6 In addition to those for all age groups,
7 we've looked at this as a life stage kind of
8 approach, and so iron is of particular concern
9 among adolescent and premenopausal females.
10 That's both dietary and biomarker data.

11 Older adults seem to be at risk for low
12 intakes of protein, and I showed you the data on
13 the muscle strength, as well as vitamin B12.
14 Adolescents, there was -- this is what we're
15 calling a constellation of dietary risk.

16 So this age group has the highest
17 prevalence of not meeting recommendations across
18 most nutrients, and particularly adolescent girls.
19 So protein, folate, B6, phosphorous, magnesium and
20 choline.

21 And then young children, as I showed you
22 earlier, one to three, have high intakes of

1 retinol, zinc, selenium and copper, relative to the
2 UL.

3 So our remaining work I talked about a
4 little bit earlier is what is the role of added
5 sugar in meeting food group recommendations,
6 frequency of eating, looking at beverages, and
7 meeting food group and nutrient recommendations,
8 as well as dietary patterns?

9 We already mentioned that we're going
10 to be working more with the B to 24 and Pregnancy
11 and Lactation to identify nutrients of public
12 health concern in those populations.

13 And then finally, we'll end with a few
14 pattern modeling questions. Thank you very much
15 for your time and attention. And I definitely will
16 answer questions, but we also really want to hear
17 from you guys.

18 (Applause.)

19 CHAIR SCHNEEMAN: A long presentation.
20 It was very quick, though. So you've heard some
21 questions from the subcommittee, but I think also
22 you have questions or comments for the

1 subcommittee.

2 MEMBER DONOVAN: So thanks, Regan. I
3 have two questions, and one is related to the kids
4 in the -- of early ages that are in the upper
5 limits. Do we know what food groups are
6 contributing to the high intakes of the zinc and
7 selenium?

8 MEMBER BAILEY: Yeah. We haven't
9 really looked at it that way. I could guess at what
10 I think those food sources are, but I think that's
11 premature.

12 MEMBER DONOVAN: Okay.

13 MEMBER BAILEY: And then, you know,
14 there's a lot of discussion around are those ULs
15 the right number? So it might be that the diets
16 are okay, and the ULs are often set based on
17 extrapolated data down for children.

18 So that's why we are calling it, you
19 know -- maybe this is a concern. We certainly
20 didn't want to make a statement without talking to
21 you all, but we are really unsure about to do, and
22 this is just from food alone.

1 So when we will look at supplements for
2 nutrients, those prevalences are going to
3 increase.

4 MEMBER DONOVAN: So my second question
5 was related to some of the -- primarily the
6 cardiovascular outcomes, and is there any
7 factoring in of medications that are used to manage
8 hypertension or cholesterol?

9 MEMBER BAILEY: The way the data are
10 collected is -- so particularly, some of the
11 biomarkers -- no. I mean, we know that a lot of
12 people are on statins. These are the prevalence
13 estimates for a national representative sample of
14 adults.

15 So there are people who taking
16 medications for hypertension. There are people
17 who taking medications for various things, but
18 they're in the survey.

19 CHAIR SCHNEEMAN: So Kay, and then
20 Richard --

21 MEMBER MATTES: Sure.

22 CHAIR SCHNEEMAN: -- and then -- and

1 Steve. So Kay?

2 MEMBER DEWEY: Thank you very much.

3 Kay Dewey. So first, I want to just comment that
4 the UL percent is very, very lightly -- it's too
5 low, because we see this problem across the board,
6 you know, in many countries, and so that's just one
7 comment.

8 So I have three questions. The first
9 is when you're looking at inadequate nutrient
10 intakes, we've talked about the fact that people,
11 at least for adults, tend to over -- underreport
12 their energy intake, and so that might make it look
13 like their nutrient intake is too low.

14 And I think you've talked about this,
15 but if you'd answer again whether you're attempting
16 any correction for that, or at least a sensitivity
17 analysis that would let you judge, you know, is it
18 really low, or it's just they're underreporting
19 energy?

20 MEMBER BAILEY: Yeah. We know that
21 there is underreporting of energy, but for
22 nutrients, it's really not well known how

1 differential that is. We only have recovery
2 biomarkers for a few food components, and so we
3 really can't make estimates about what other
4 nutrients are low as a result of energy
5 underreporting.

6 We haven't really talked about
7 sensitivity analysis. I know there's been some
8 work done with the survey before, so we might want
9 to look at -- especially the nutrients that we do
10 agree are a public health concern, maybe we could
11 do a sensitivity analysis, trying to exclude energy
12 underreporters, and see what those prevalence
13 estimates would look like.

14 That's a really good idea.

15 MEMBER DEWEY: Well, you know, I was
16 thinking more along the lines of if we assume that
17 underreporting is not the assumption -- not
18 necessarily a the assumption, but for a sensitivity
19 analysis, if you're assuming that, you can then
20 apply it as a correction factor across the board,
21 just to see which ones would still emerge as being
22 under the EAR, for example.

1 MEMBER BAILEY: Yeah, but people
2 differentially underreport specific food
3 components, like alcohol or sugars, and those
4 aren't things that really would be good nutrient
5 sources anyway, so I don't know that we could have
6 a correction factor.

7 MEMBER DEWEY: Okay. Well, anyway,
8 something to think about. The second the question
9 is regarding the birth weight outcome you reported,
10 and just in terms of low birth weights, I
11 remember -- and maybe I don't remember. But do we
12 have estimates for SGA, LGA, and preterm?

13 MEMBER BAILEY: Yeah. We don't have
14 preterm right now that I have seen, but we do have
15 all the anthropometrics. We can give you guys all
16 that data, probably be a good conversation to have
17 together.

18 MEMBER DEWEY: Yeah. And one of the
19 issues to take into account is the multiple births
20 and trends in those, because those drive a lot of
21 those numbers. And then lastly, there was a slide
22 where you had a bunch of nutrients, and then you

1 crossed them out, and I think it was based on
2 whether there was a biomarker or some other --

3 MEMBER BAILEY: Not whether there was
4 a biomarker --

5 MEMBER DEWEY: Or --

6 MEMBER BAILEY: -- but whether that was
7 linked to low intake. So for example, vitamin E,
8 there is a very prevalence of vitamin E inadequacy
9 if you look at the diet, but when you look at the
10 biomarker, it's less than 1 percent.

11 MEMBER DEWEY: So when it was crossed
12 out, it meant that --

13 MEMBER BAILEY: That it wasn't
14 confirmed with a biomarker or a clinical outcome
15 endpoint.

16 MEMBER DEWEY: But what if there is no
17 biomarker? Was it crossed out?

18 MEMBER BAILEY: No, I don't think so.
19 Like what are you thinking of? We try to be,
20 like -- all the ones that we were -- special case
21 that we wanted to talk about, which if we could pull
22 up that last slide, that might be helpful.

1 But for a lot of those, they do have
2 biomarkers or no clinical endpoint. Like we have
3 vitamin C from the blood, we don't see a lot of
4 scurvy. You know, so that's why that could be
5 crossed out.

6 CHAIR SCHNEEMAN: So can you go
7 backwards --

8 MEMBER BAILEY: I put it at the end, so
9 I was anticipating this. Okay. Perfect.

10 CHAIR SCHNEEMAN: I think she was
11 looking at the table where you listed everything
12 that was --

13 MEMBER BAILEY: That might take a
14 minute.

15 MEMBER DEWEY: Okay. So here's the
16 list, and then if you could explain what were the
17 reasons for crossing the ones that are crossed out?
18 I just didn't -- you went fast.

19 MEMBER BAILEY: Okay. So probably not
20 a nutrient by nutrient, but there was not a
21 biomarker that could confirm low dietary intakes
22 were a problem, and there was not -- it was not

1 related to any clinical or health outcome.

2 MEMBER DEWEY: Okay. So in some
3 cases, there is a biomarker, but it didn't show a
4 problem --

5 MEMBER BAILEY: Right.

6 MEMBER DEWEY: -- but in other cases,
7 there is no biomarker, so we don't know.

8 MEMBER BAILEY: So what are you
9 thinking there's no biomarker?

10 MEMBER DEWEY: Well, I'm just -- well,
11 I --

12 MEMBER BAILEY: Can you go back to the
13 flowchart? There we go. Okay. So we would start
14 with -- there are -- for most things, we have
15 dietary data available. So is that available?
16 Yes.

17 Are the prevalence estimates within the
18 threshold, is it more than 5 percent of the
19 population or any population subgroup that might
20 have a problem? Yes. Then is there a biomarker
21 available? Yes.

22 Is there suggested evidence of a risk

1 supported by a biological or clinical indicator?
2 No. Like, you know, every path on -- you put the
3 nutrient through -- each nutrient through this
4 kind of pathway to see what was available.

5 MEMBER DEWEY: Okay. So the specific
6 question I have is, the arrow that goes from "Are
7 biomarker data available?" And it says, no.

8 MEMBER BAILEY: Uh-huh.

9 MEMBER DEWEY: And it goes to the left
10 and it says "Lack of evidence to be considered a
11 nutrient or food component of public health
12 concern." Are there any nutrients where there is
13 no biomarker?

14 MEMBER BAILEY: Fiber. And it is a
15 nutrient of public health concern, because it's
16 linked to a clinical outcome.

17 MEMBER DEWEY: Okay. So there's
18 only -- yeah. So basically none of them have been
19 excluded on that basis. Okay. Thank you.

20 MEMBER BAILEY: That was a long way
21 around. Sorry. I didn't get that question.

22 CHAIR SCHNEEMAN: No, but --

1 MEMBER BAILEY: But I spent so much
2 time on this, so I just really have to --

3 CHAIR SCHNEEMAN: I know. It's burned
4 into your mind, so you've got to bring us all along.

5 MEMBER BAILEY: And it's the color.

6 CHAIR SCHNEEMAN: So I can -- did you
7 have anything --

8 MEMBER DEWEY: No.

9 CHAIR SCHNEEMAN: Okay. So Rick?

10 MEMBER MATTES: Rick Mattes. I'm not
11 trying to add anything to your plate, but when you
12 look at beverages, will you be looking at them when
13 consumed alone versus with meals? It's a question
14 that comes up quite often, and it's kind of
15 relevant.

16 I mean, beverages serve functions.
17 When they're consumed with a meal, they help you
18 swallow, and it doesn't mean that one has to use
19 a sweetened beverage to accomplish that, but
20 weighing costs and benefits and hydration or not,
21 it is a more complicated question of knowing to what
22 degree beverages alone are contributing energy and

1 nutrients.

2 MEMBER BAILEY: Yeah. We don't have
3 that built into the analytic framework right now,
4 but I think that can be something that we
5 incorporate into the report as a research
6 recommendation --

7 MEMBER MATTES: Yeah.

8 MEMBER BAILEY: -- something that
9 could be looked at.

10 CHAIR SCHNEEMAN: Yeah. Is it
11 available?

12 MEMBER BAILEY: Every eating occasion
13 is recorded as a separate eating occasion. So you
14 could do it that way. So if someone just reports
15 a beverage, you could separate that out with the
16 NHANES data.

17 CHAIR SCHNEEMAN: Dr. Heymsfield?

18 MEMBER HEYMSFIELD: How was strength
19 measured?

20 MEMBER BAILEY: With hand grip.

21 MEMBER HEYMSFIELD: Hand grip?

22 MEMBER BAILEY: Yeah.

1 MEMBER HEYMSFIELD: Because what
2 caught my eye was the Asians have highest
3 prevalence of low strength, and you use that
4 measure for a sarcopenia diagnosis, and strength
5 is related to body size. I wondered if adjustments
6 were made for body size?

7 MEMBER BAILEY: No. These -- what we
8 presented today are just prevalence estimates. At
9 some point, they were age-adjusted when I specified
10 that for things that -- like cancer, but we haven't
11 done it like that for the muscle data, but that's
12 a good idea.

13 So that does bring up the point about
14 protein, and it's low in older adults. There's a
15 rather high prevalence of low muscle strength.
16 How do you feel about that in terms of would that
17 rise to the level of something you would consider
18 to be a public health concern?

19 I'm not putting you on the spot --

20 MEMBER HEYMSFIELD: Yeah.

21 MEMBER BAILEY: -- specifically, but I
22 mean, that --

1 MEMBER HEYMSFIELD: I'm not sure I know
2 the answer.

3 MEMBER BAILEY: You can just say,
4 tangerine. You know, that's an option for you.

5 MEMBER HEYMSFIELD: Yeah. Just work
6 with NHANES data a lot and am very interested in
7 sarcopenia, and I think the body size is a very
8 important covariant in that analysis, so I think
9 before you make any conclusions about Asians
10 being -- lacking strength, you need to really
11 adjust for body size in some way.

12 I'm not sure how, but --

13 MEMBER TAVERAS: In the same vein of
14 not wanting to add anything to this long list, but
15 there are two things that I was going to ask about.
16 One was, you talked about obesity in the adults but
17 not in children, and I think there are really good
18 definitions and NHANES, I think, now is reporting
19 on severe obesity in children.

20 So I would ask if that is available and
21 going to be included?

22 MEMBER BAILEY: So Jamy did some

1 follow-up on body composition data. Do you recall
2 if those numbers --

3 MEMBER ARD: I am sure they're probably
4 there, severe obesity for children. So I think
5 that should be included. Yes.

6 MEMBER TAVERAS: And along those same
7 lines with an increase in severe obesity, we're
8 starting to see nonalcoholic liver disease in
9 children, and it's not one of the outcomes, so --

10 MEMBER BAILEY: That wasn't measured.

11 MEMBER TAVERAS: It wasn't?

12 MEMBER BAILEY: Children -- but we
13 talked a lot of about that. We really know that
14 that's an issue, and we wish we had more data to
15 address that.

16 MEMBER NAIMI: Yeah. If
17 I -- that's -- some of the elevated ALTs and ASTs
18 in adults are accounted for by fatty liver, by
19 alcohol as well as by hepatitis C, but there's no
20 way to tease those apart. And the AST/ALT for kids
21 B-

22 (Off-mic comments.)

1 MEMBER MAYER-DAVIS: Yeah. So again,
2 speaking of adding things, so you mentioned that
3 HEI was available for the cycle of NHANES data that
4 you are using, but not other indices related to
5 dietary patterns, and not wanting to, you know,
6 steal any thunder from my colleague here to my left,
7 you know, a variety of dietary patterns, you know,
8 are -- you know demonstrate some really
9 interesting findings.

10 So I don't know how impossible is it to
11 look at other types of indices related to dietary
12 patterns beyond the HEI?

13 MEMBER BAILEY: Yeah. I agree with
14 you. I think that there are a lot of different
15 dietary patterns, but when we really looked at this
16 data, it boiled down to five food groups that were
17 contributing almost half or more energy.

18 So I think what we're looking at is an
19 American pattern. I think there's variations in
20 there. But from the 2015 to 2020 extensive work
21 on dietary patterns, they recommended only indexes
22 and scores be applied to characterize dietary

1 patterns because, after a cluster analysis, were
2 subject to too many decisions, and couldn't be
3 reproduced across cohorts.

4 MEMBER MAYER-DAVIS: Right.

5 MEMBER BAILEY: And so --

6 MEMBER MAYER-DAVIS: So I was thinking
7 more specifically about Mediterranean diet, for
8 example, or DASH as another example.

9 MEMBER BAILEY: Well --

10 MEMBER MAYER-DAVIS: And I completely
11 agree with you --

12 MEMBER BAILEY: So the National Cancer
13 Institute has a dietary patterns methods
14 project --

15 MEMBER MAYER-DAVIS: Yes.

16 MEMBER BAILEY: -- and they use all the
17 different scores, and there's a very high
18 congruency between the HEI and the Mediterranean
19 score and the DASH index. I'm not saying there's
20 perfect agreement, but they're pretty robust.

21 MEMBER BOUSHEY: Want me to back you up
22 on that?

1 MEMBER BAILEY: Sure do.

2 MEMBER BOUSHEY: Yeah. That's what I
3 was going to say. I mean -- and the other issue
4 is creating those dietary patterns, you know, for
5 individual food items is actually a little -- it
6 is more challenging, not that it wouldn't be a
7 wonderful thing to do.

8 It's just that it would be a large
9 investment of time on your part, and we do know with
10 the adult data from the dietary patterns methods
11 project, but they are -- they all come out very
12 similarly.

13 MEMBER BAILEY: But I really do hear
14 your point, Beth --

15 MEMBER BOUSHEY: Yeah.

16 MEMBER BAILEY: -- and you know, we
17 know what they're not doing. They're not doing
18 this, but we don't know what they are doing, and
19 I think it could be a research recommendation that
20 future committees walk in the door with knowing
21 what the existing patterns are that are different
22 than just HEI. That would be very helpful.

1 MEMBER MAYER-DAVIS: Yeah. Because
2 there are established approaches to these scores,
3 some of which are more common in the literature,
4 but some are, you know, fairly obscure.

5 MEMBER BAILEY: Uh-huh.

6 MEMBER MAYER-DAVIS: So -- yeah.

7 MEMBER BOUSHEY: I wanted to give you
8 a shout-out, a team shout-out. Your screener that
9 you developed addressed one of the very comments
10 that have come from the National Academy of
11 Sciences report, so you have a lot to be proud of.
12 That really answered a big question, that you have
13 a method now of looking at these nutrients of
14 concern. So I really have to give you a shout-out.

15 MEMBER BAILEY: We really took that
16 report to heart when we were developing this, but
17 what we realized is that system works nutrient by
18 nutrient, but it failed us when we came across the
19 adolescent females, because we were like this is
20 how we're going to say something is a food component
21 of concern.

22 And then we were like wait a minute. We

1 have this high-risk -- what we consider to be a
2 high-risk group, but -- so nothing is perfect, but
3 we thank you very much.

4 CHAIR SCHNEEMAN: Actually, related to
5 that topic -- and first of all, let me remind the
6 Committee that the subcommittee has also asked for
7 your input on presenting the conclusions around the
8 chronic health conditions.

9 And if you'd recall -- and you can look
10 back at your slides -- but there's a general
11 statement, and then Regan went through a lot of very
12 specific data. And so part of the question that
13 is being asked is, how do we represent -- well, how
14 do we find a balance in representing that? Do we
15 do just a general statement and then each one
16 separately? Or do we need an overall conclusion
17 statement?

18 And then the other that I think we have
19 gotten some discussion is looking at these
20 nutrients of public health concern.

21 And I'm going to ask you about
22 potassium, because I know that potassium was below

1 the AI across the food groups, but we also have the
2 new DRI report which did not give us a chronic
3 disease reference value for potassium.

4 And so maybe just -- some of you in the
5 subcommittee are thinking about potassium as a
6 nutrient of public health concern.

7 MEMBER BAILEY: Yeah. As you know,
8 the DRI was recently updated, and we talked about
9 this. Jamy, if you want to -- can you summarize
10 what we said in our small group meeting yesterday
11 about potassium from -- Jamy was on the committee.

12 MEMBER ARD: Sure. So the issues with
13 potassium, from a clinical standpoint -- yes,
14 there are no issues with people coming into primary
15 care and emergency rooms with rampant hypokalemia.
16 So that's not an issue.

17 I think the main potential chronic
18 disease risk related to lower potassium intake is
19 related to cardiovascular disease, and in
20 particular, hypertension, and some of the sequelae
21 of that.

22 So you know that there's a relationship

1 between higher potassium intake and lower
2 prevalence of high blood pressure. We know that
3 there are differences in subpopulations in terms
4 of potassium intake and some of those differences
5 maybe explain some disparities in outcomes and
6 health outcomes.

7 So for minority populations,
8 African-Americans in particular, you see higher
9 prevalence of hypertension, lower intake of
10 potassium in that group. And we also know that
11 potassium has a blunting effect in terms of the
12 hypertensive effect of sodium.

13 So in populations where potassium
14 intake is higher, even for a higher sodium intake,
15 you see a less robust response in terms of blood
16 pressure.

17 So I think part of the discussion we had
18 yesterday was there could be an argument made that
19 potassium intake is part of the public health
20 concern group, even though we don't have some of
21 the, you know, sort of classical direct links; you
22 have more indirect ones, per se.

1 But there is a body of evidence that
2 supports the idea that higher potassium intakes may
3 actually have an impact at the population level.
4 So I think that, you know, summarizes the points
5 in the discussion.

6 MEMBER BAZZANO: Lydia Bazzano. So I
7 would second what Jamy just said, Dr. Ard, and also
8 in terms of nutrients of concern, I know Steve can
9 speak -- I know you all did not specifically say
10 protein in older adults, but I think, you know,
11 given the levels that -- the prevalence that we're
12 seeing, I think they probably should be concerned.

13 MEMBER DEWEY: Kay Dewey. I have
14 another question. I think the list of nutrients
15 where you were examining whether they were of
16 public health concern did not include fats, and is
17 there a reason for that?

18 MEMBER BAILEY: Yes. We hadn't looked
19 at that data specifically, but you've reminded me
20 that we really need to do that. So we looked at
21 saturated fats, but we didn't look at other fatty
22 acids so we should absolutely do that. Thank you.

1 CHAIR SCHNEEMAN: Any comments, any
2 questions?

3 Regan, do you want to put that draft
4 conclusion statement up, and let's see if
5 there's -- ah. Great.

6 So I guess the question, though, is are
7 we comfortable with this general statement,
8 knowing that the report itself will go through some
9 of the details that Regan has presented?

10 And again, it's still a draft,
11 so there's still some tweaking that probably needs
12 to be done.

13 MEMBER ARD: So the alternative to that
14 statement is something that then calls out some
15 specific chronic diseases that, you know, may be
16 of more interest or more concern.

17 So as an example, we had nominated
18 something like dental caries and metabolic
19 syndrome and diabetes as being really concerning,
20 as well as increasing rates of mortality related
21 to chronic liver disease.

22 So these were things that were, you

1 know, somewhat striking for us as we reviewed the
2 data, but they were, you know, our perspective.
3 And so I guess the question is, do we just leave
4 this very general and be very generic and point out,
5 you know, things that we all know?

6 Chronic disease is increasing and the
7 disparities, and you know, it's worse in some
8 subgroups compared to others, and we could stop
9 there.

10 Or we could, you know, incorporate or
11 call out things that we think are, you know,
12 particularly concerning, either across life stages
13 or related to other things that, you know, would
14 be relevant for some of the questions that other
15 subcommittees are dealing with, or related to
16 things that we think are relevant, you know, with
17 regard to where particular recommendations might
18 go or be needed for emphasis?

19 MEMBER DEWEY: Kay Dewey. So one
20 thought is to at least highlight in some way the
21 outcomes that are being examined in some of the
22 literature reviews that the different

1 subcommittees are doing.

2 So the certain cardiovascular disease
3 outcomes are part of several of those, and also
4 growth, size, and body composition, so overweight
5 and obesity. All those come to my mind as
6 deserving to be highlighted, because we are going
7 to talk about whether diet is related to them.

8 MEMBER NOVOTNY: Just in general, I
9 would like us to think about what to do with weight
10 status or overweight/obesity. I see it's kind of
11 listed as a -- almost like a demographic, and
12 whether it goes along with health condition or
13 whether we have to like call it out as an
14 intermediary, metabolic syndrome was mentioned in
15 your review. It's closer to the diet than the
16 pathway of many of the conditions. So just to -- I
17 think we should think about where that goes and
18 follow it.

19 MEMBER TAVERAS: I wonder also if you
20 can group them in that way, that some of these are
21 obesity-related and make the summary a little
22 more -- that the cluster is associated with

1 obesity?

2 MEMBER DONOVAN: Yeah. I'm sort
3 of -- I'm just struggling on whether this is
4 appropriate or how to say it, but I guess when I
5 was looking at your comments and you were talking
6 about racial/ethnic differences, that to me, it
7 seems like we also need to include socioeconomic
8 status and potential health care coverage, because
9 I don't think it's just genetics.

10 Right? And that was kind of led to my
11 respect of the genetic components, but we also
12 disparities in prevention, and I think these
13 differences are because people who have health
14 insurance are getting their medications and
15 they're getting earlier screening of prediabetes
16 and they're getting a lot more prevention, and diet
17 intervenes with that, but it's, you know, a broader
18 issue, and it's quite beyond the scope of dietary
19 guidelines.

20 But this aspect of, you know -- to give
21 you more work, if we could look at things
22 beyond -- you know, other demographics in terms of

1 SES or health care or SNAP utilization
2 or -- because to me, that leads directly to
3 potential application of dietary guidelines in
4 nutrition programs.

5 MEMBER BAILEY: Many of our protocols
6 have food security --

7 MEMBER DONOVAN: Yeah.

8 MEMBER BAILEY: -- included --

9 MEMBER DONOVAN: Right.

10 MEMBER BAILEY: -- to try to get --

11 MEMBER DONOVAN: Right.

12 MEMBER BAILEY: -- a
13 different -- other than just, you know, how much
14 money does your family have? How is that money
15 distributed towards nutrition specifically? So
16 that's ---

17 MEMBER DONOVAN: That would be great.

18 MEMBER BAILEY: -- yeah.

19 MEMBER MAYER-DAVIS: Just looking at
20 this statement, I very much appreciate Rachel's
21 comment -- this is Beth Mayer-Davis -- to pull out
22 obesity, and then frame obesity-related

1 conditions.

2 I think that's part of calling out and
3 being more specific. Thinking back to Jamy's
4 comment, particularly about, you know, some of the
5 areas that, you know, maybe are not above the radar
6 right at this moment, you know, like increasing
7 mortality related to liver disease, like dental
8 caries.

9 So seeing those data, we're not
10 necessary surprised, but it's not necessarily what
11 would have been front-of-mind, and so you know, I
12 think that was really a good comment. So I think
13 taking opportunity to be a little bit more specific
14 here, in that regard.

15 And then my second part of this comment
16 has to do with being more explicit about health
17 equity and inequity, because that's really, you
18 know, what we're talking about.

19 And I think that's really important as
20 we think about the Dietary Guidelines with respect
21 to informing federal food policy, which is about
22 food security, access, all those kinds of things.

1 So I'd like to, you know, see that aspect of health
2 equity brought out as well.

3 CHAIR SCHNEEMAN: So we're reaching
4 the end of our allotted time, but one of the things
5 that Dr. Kleinman and I have been talking about is,
6 as one of the chapters, it's important for us to
7 start integrating the work of all the subcommittees
8 and where do we come to after addressing all of
9 these questions.

10 And so I'd like to just finish the
11 meeting by maybe going around if we had any
12 particular thoughts about that issue, or kind of
13 what Regan was asking the Committee about. It's
14 an opportunity for you to get some final comments
15 for today, based on what we've been hearing.

16 And are you beginning to see some things
17 that sort of emerge to top priority from the work
18 that your subcommittees are doing? So it's always
19 tough to figure out who goes first. I'm going to
20 pick on Kay.

21 MEMBER DEWEY: Well, I mean, the
22 challenge that we have is integrating across the

1 B to 24 age group, because this is the first time
2 that recommendations for this age group are going
3 to be this report, and as you all know, we have
4 multiple outcomes for the same exposure, and so we
5 haven't yet talked about how to integrate across
6 those.

7 Yeah. Well, one thing I do want to
8 repeat that I said at the last meeting, to make sure
9 everyone is aware, that we are only looking at a
10 subset of all the different types of eating advice
11 that might be given for this age group, and in
12 particular, we're focusing on the what to feed and
13 not the how to feed.

14 So a general question then is, how far
15 do we go in even talking about the ones where we
16 have not done systematic reviews. And so any
17 advice I throw back to you that the overall
18 Committee would like to give us on how that gets
19 approached would be very helpful.

20 MEMBER DONOVAN: I mean, I've just been
21 seeing -- we haven't really had the opportunity to
22 speak in terms of Regan's committee on intakes and

1 the prevalence of things like gestational diabetes
2 and all of those.

3 So I think that will be important to
4 start to integrate, and you know, and while
5 pregnancy and lactation has been a component of
6 previous Dietary Guidelines, I think pulling out,
7 you know, this sort of special life stage, as we're
8 taking that life stage approach and thinking not
9 only about improvements for maternal health,
10 because we certainly know that women with
11 gestational diabetes are at higher risk for type
12 2 diabetes later.

13 So again, we haven't really had a lot
14 of time to think about that, I think, in terms of
15 integrating the data in terms of whether pregnant
16 or lactating women are actually consuming and
17 what are the incidence of these health conditions?

18 But I think what we have seen, you know,
19 from both in B-24 and Pregnancy and Lactation, we
20 have a lot of inability to draw conclusions because
21 the data sets -- the data is just not there.

22 So clearly, as we move forward -- and

1 there was a comment earlier about research needs.
2 And we'll have very long lists of research needs,
3 and so that's -- again, I think at the end, we'll
4 be able to make some conclusions, but
5 unfortunately, I don't think very many of them will
6 be strong, but we'll have lots of recommendations.

7 MEMBER BAILEY: I really like the life
8 stage approach that we're taking, and it's very
9 clear for B to 24 and Pregnancy and Lactation.
10 They have specific working groups. It's been less
11 clear to me how to handle the other life stages.

12 And so integrating all the information
13 from the different life stages is going to be a
14 little bit more challenging, but I think really,
15 really important.

16 And then the other thing that really
17 stuck out to me in going through all of the data
18 that we did is that foods and nutrients are
19 inextricably linked, when you see that the food
20 changes over time, and we see that mirrored with
21 nutrients. And I feel it's very important that we
22 meet people where they are in terms of

1 recommendations. So people are consuming a lot
2 of --

3 MEMBER DONOVAN: Burgers and
4 sandwiches.

5 (General laughter.)

6 MEMBER BAILEY: So we have to give them
7 tools and strategies to do that in a better way,
8 not just, you know, you need to eat more of this,
9 eat less of that. But giving them real strategies
10 for success, I think, will be something that is
11 important, at least from my perspective.

12 MEMBER NOVOTNY: What I'm thinking
13 about is really integration and just trying how to
14 weave this in a useful way, like a sentence, but
15 I think the problem is this last point about
16 socioeconomic status and the -- I know
17 socioeconomic status has been in our models as a
18 variable to consider, but given the potential use
19 of our findings, I'm wondering whether we should
20 be looking at the different subgroups in order to
21 inform policy, and indeed, whether there should
22 have been other kinds of variables in our models

1 that might have helped us, like food security or
2 something about health utilization.

3 I'm not sure also about the
4 race/ethnicity route, whether that's going to be
5 the most helpful way to go about it, but that's what
6 I'm thinking about.

7 MEMBER STANG: I would follow up
8 with -- I think we've talked about the life span,
9 but also thinking about the life course approach.
10 So the fact -- when we were looking at the data
11 yesterday, we saw these adolescent females with
12 this constellation of poor nutrition, and I'm
13 thinking, these are our future mothers.

14 And so there's this whole circular
15 piece that what's important during pregnancy and
16 lactation informs what happens to the children,
17 which then grow up to be mothers themselves or
18 fathers.

19 And so somehow to weave that piece
20 throughout the report that there's this
21 generational piece that I think often we miss
22 because of the way that data is collected or

1 reported, but it has a lot of contextual
2 implications for the recommendations we make.

3 MEMBER TAVERAS: I was thinking, I
4 guess, three things.

5 One, Sharon mentioned, it's
6 discouraging to see so much insufficient evidence
7 and inability to make conclusions from very little,
8 in some cases, data that is out there and results.

9 And I think that's going to be really
10 important as we summarize, because I think there
11 is quite a bit of attention on what is going to
12 emerge from here, and I think we'll have to be
13 careful with how do we frame this in a way that sets
14 up the next Dietary Guidelines or the next
15 Committee on what were some of these research
16 recommendations, and where we might be able to
17 contribute for research purposes for the next
18 round?

19 I'm struck, Reagan, with the
20 conversation we just had about so many of these
21 chronic diseases are obesity-related and the
22 increase in trends and the prevalence of obesity,

1 and I think that's important.

2 I think we have to call it out. Even
3 if all the chronic diseases, cancer, CVD, if they
4 all cluster around obesity, I think that it is going
5 to be important that we really drive that home,
6 because in our subcommittee and in many others,
7 growth size and body composition is something we're
8 paying close attention to.

9 And then the only other thing that I
10 found interesting is there is a big drop-off -- and
11 maybe because I am a pediatrician and I think a lot
12 about the child diet, but there are some really
13 interesting patterns from two to five to six and
14 older that seems to be this critical point where
15 so many of the other patterns that you showed are
16 deteriorating and decreasing.

17 And I wonder if there's a way -- as we
18 talk also about life course and life stage, if we
19 can point out some areas of opportunity in either
20 these critical periods or setting staff to work
21 with people and populations in those critical
22 periods, that there might be more room for

1 influencing diet in those settings and age groups.

2 MEMBER DONOVAN: I think -- I looked at
3 that too as kind of the child care to school, and
4 there's different policies in school lunch and in
5 CACP, and so I think that's a really smart
6 observation.

7 MEMBER MATTES: Yeah. I don't want to
8 just be redundant, but to amplify the importance
9 of paying attention in our discussion sections
10 about future directions, that this is so
11 disheartening.

12 We spent so much time building these
13 models, to find the greatest science, and we're all
14 ending up with science that isn't answering the
15 questions, and so it's vital that we encourage
16 future researchers to design their trials so that
17 we can get to the bottom of all this.

18 The only other thing that I felt
19 compelled to comment on, but nobody anywhere has
20 talked about food palatability. I mean, there are
21 certainly issues and disparity issues and so on
22 with regard to access and so on, but the primary

1 reason that we pick one thing over another is
2 because we like one thing more than another, and
3 so I hope we don't lose sight of that, and somehow
4 we can leave this in, that we have to pay attention
5 to that component of food.

6 MEMBER BAZZANO: So I like the life
7 course approach and the life stages approach that
8 we're taking, and I do think, you know, that it's
9 important to distinguish the different periods
10 because nutrition is different and the needs are
11 different in different periods of time, and
12 specifically I think in the older adults, you know,
13 we need to think about that as well, that so far,
14 we're kind of all lumped in as adults. So you know
15 I think that might be a particular group with
16 particular outcomes to be focused on.

17 And then the other thing I wanted to
18 mention was also kind of along the lines of what
19 Richard, Dr. Mattes just mentioned, that the data
20 that we have, all of these studies, we've been
21 reviewing a lot, a tremendous amount of studies,
22 most of which are not actually designed to study

1 what we're trying to use them to -- the question
2 that we're trying to use them to answer.

3 So that's a different issue, but it does
4 get to the importance of research for the specific
5 questions that we want to answer.

6 MEMBER SABATÉ: I agree with many of
7 the things that has been said, and I think on the
8 last presentation, I think it struck me that the
9 way that the menu must be -- almost everything is
10 concentrated in sandwiches and burgers.

11 So it's culprit of many things, but also
12 an opportunity. And I think that changes in social
13 trends from different perspectives, not only from
14 food, but also from the perspectives of
15 sustainability and taste. I think this is an
16 opportunity to try to improve the health of
17 Americans, but also tackle other social issues that
18 are concern to today's society.

19 MEMBER LEIDY: I'm not sure if I can add
20 too much to the conversation when we get around to
21 this point, but there's just a couple of things that
22 have come to mind. You know, I think we've all said

1 it.

2 It's surprising right now when you see
3 that there's just a lot of limited evidence, and
4 the evidence that exists seems to be from cohort
5 studies, when we only say we use randomized trials,
6 and I feel like now that kind of just goes to the
7 wayside, because we know we need them.

8 It's that next step of how do you make
9 that happen, you know, from a funding standpoint
10 of getting that out. But I still think that's a
11 vital part of trying to answer some of the questions
12 that we have.

13 So it was more of a surprise. Maybe
14 we'll all sandbagging writing waiting till the end,
15 until March, when all the data come out. I don't
16 think that's the case, but it would be nice if it
17 was. An unrelated issue -- when I look at the food
18 patterns and I think I talked to Regan at lunch a
19 little bit about the different food groups, and I'm
20 struck by the fact that even when we look at whole
21 grains and whether there's an increase in whole
22 grain consumption, we also see that a lot of whole

1 grains that are -- whether they're recommended or
2 they're either in schools or what-not, also have
3 an added sugar component to them.

4 And you know, we'll look at
5 interventions, at least from -- you know, if
6 they're doing added sugars or whatnot, but I think
7 that's just a point that I don't -- we kind of
8 missed that.

9 We look at the food groups and we see
10 where they're coming from, but I'm not sure if we
11 can then tie that fact into a health outcome to say,
12 you know, whole grains may be beneficial, but as
13 an example.

14 But if they're, you know, including
15 added sugars, then a lot of those maybe potential
16 health benefits go away, and I don't know -- we
17 probably may not be the group to do that, but it's
18 just something that, even looking at the food
19 groups, if we could really separate them out based
20 on some of the other food components that are part
21 of that, and whether that's dietary patterning, I'm
22 not sure that where that fits. It's just something

1 that I always see when we look at the different food
2 groups, that other components, other nutrients
3 with some of the other healthier food items, and
4 it's just hard to tease that out.

5 And then just a last point. You know,
6 when we look at the different life stages, and
7 adolescents, particularly females, are, you know,
8 the group of interest from a nutrient standpoint,
9 we also -- I know at least from the literature that
10 there are very few studies in that population.

11 So they kind of go hand in hand. You
12 see the nutrition issues, but they're not always
13 linked with some of the other health outcomes
14 usually for compliance or attrition with that
15 population. But I think that's a really big area
16 for future recommendations.

17 MEMBER ARD: So I think we have not
18 gotten to the dietary patterns section yet, but if
19 I would say something that integrates what we're
20 talking about, I think tomorrow we should hopefully
21 be able to have more discussion about the sort of
22 idea of dietary patterns, when they -- you know,

1 sort of concept that we can double-down on, and that
2 was brought forth in the previous Guidelines.

3 And I think it speaks to several things,
4 you know, what Heather just talked about and what
5 Regan talked about, where nutrients are not
6 consumed in isolation, and foods are not consumed
7 in isolation, when I have my burger and sandwich,
8 I'm also going to have my starchy potatoes, and my,
9 you know, sugar-sweetened beverage.

10 Right? You know these things travel
11 together in the American pattern, and we need to
12 acknowledge the idea that across life stages and
13 in the life cycle, these patterns tend to change,
14 and even from, you know, the use of complementary
15 foods, and how, you know, we feed infants -- those
16 things are starting to develop early. And so if we
17 could think about that idea of how we help inform
18 people around those, you know, concepts of foods
19 traveling together.

20 And then I also think, you know, with
21 regards to the idea of calling out obesity, that's
22 very important, but we haven't really talked about

1 energy intake.

2 And so at some point, we've got to deal
3 with that piece of, you know, how we integrate that
4 into all of what we're talking about, because I
5 think at the end of the day, quality matters, foods
6 matter, nutrients matter. But energy is very
7 important.

8 MEMBER DAVIS: I think it's very
9 important that our report is looking at life stage,
10 and this will be the first time that we've ever
11 looked at it from birth all the way up to the elderly
12 population, and I think our doing it that way,
13 presenting our report by life stage, is more useful
14 for the end user, for the public.

15 And indeed I think we can look at
16 certain things that we've seen in dietary intake
17 of the trends over the last few years. For
18 example, there's been a slight increase in whole
19 grains. Although whole grain intake is fairly
20 low, there's been a slight increase, and is this
21 because the Dietary Guidelines have reported this,
22 and then I think industry may be reacting to this,

1 so they're putting more whole grains into, for
2 example, breakfast cereals and bars, and so forth.

3 So I think, you know, our report is
4 quite important in informing the public, but also
5 industry that feeds the public.

6 MEMBER HEYMSFIELD: Tomorrow, I'll
7 give the report from the Frequency of Eating
8 subcommittee, and I think that's a very important
9 front-end part of our report, is what you going to
10 generate from NHANES data. So I'm really looking
11 forward to what that will be, because from what
12 we've found so far, there's huge gaps in
13 literature, and we spent a lot of time trying to
14 define what we mean by frequency of eating and
15 digestion and so on.

16 So it would be very good for you to work
17 with us so we make sure we have the same definition
18 of frequency of eating.

19 MEMBER SNETSELAAR: I also think that
20 what we're doing in this Committee in terms of
21 looking at younger age groups is incredibly
22 important, and much of what has come up through this

1 Committee is the idea that we want to be consistent.

2 We want to be sure that we're working
3 together as subcommittees, and particularly, as we
4 focus on these younger age groups, being very
5 careful to ensure that we have conclusion
6 statements and then grading that it is very
7 consistent across committees I think is very
8 important.

9 MEMBER MAYER-DAVIS: This is Beth
10 Mayer-Davis. Just wanted to note that to some
11 extent by design some of the questions that we've
12 addressed have had quite small numbers of studies
13 that sort of made it all through.

14 But to some extent, that was by design
15 so that we would get our systems in place, and made
16 sure that we were proceeding, you know, in
17 appropriate fashion.

18 So I can at least tell you that, for
19 Beverages and Added Sugars, some of the questions
20 to come have much larger bodies of evidence, so they
21 will not all be three studies here or four studies
22 there, for better or for worse. Right?

1 So you know, again, not wanting again
2 to steal the thunder from Carol's report on dietary
3 patterns, you know, that subcommittee talked about
4 yesterday, and it is relevant, I think, at this
5 point.

6 Jamy alluded to this a little bit as
7 well. I think by way of integration across
8 subcommittees, having a framework of thinking
9 about dietary patterns and what we've been thinking
10 about by way of hierarchy of dietary patterns,
11 foods and nutrients, I think that will help with
12 some cohesion, including how we integrate across
13 subcommittees, you know, so for example, thinking
14 about the Beverages and Added Sugars committee.
15 Thinking about seafood and fats, and how, you know,
16 those elements come into play with the dietary
17 patterns.

18 So I think that will be an important
19 aspect that will help us in terms of integration.

20 MEMBER BOUSHEY: I could say wow
21 everyone said it. But no I have a list, and actually
22 it's a list that supports things that have really

1 been said, and I -- Steven, Beth -- you know, Beth
2 is working on this beverage guidelines.

3 I thought going through and describing
4 all those beverages, that's like doing minor
5 surgery. We really have an issue with vernacular,
6 and a lot of it is driven by popular words, but I
7 think we do need to concentrate a bit on how we can
8 make sure that what we're doing now will be
9 repeatable, that we use language that does describe
10 what people are eating and the activities.

11 And part of the challenge of this is
12 think about your beverages. Twenty years ago, we
13 only had like one soda that you could select. You
14 know, so really, we're facing a new world where we
15 get really new foods, you know, almost every year.

16 And so that's a burden on our Committee,
17 and we have to somehow think of how to make all that
18 make sense and to be able to bring it all together,
19 because this idea of Kay's -- you know, really we
20 do need -- Kay said we need to put together all of
21 our work across all of our groups.

22 And I thought that was a great

1 suggestion. And, Rick, about your palatability,
2 I think it's surprising that burgers and sandwiches
3 are so high, and yet we have, you know, this low
4 whole grains. It just doesn't make sense, does it?

5 So we really have a lot to do to make
6 these guidelines exciting, that people want to
7 follow them, that people see them as
8 something -- hey, I'd like to do that, but -- and
9 I'm not sure that we can do that, but let's try to
10 think that we can.

11 Thank you.

12 CHAIR SCHNEEMAN: So I'm going to give
13 you the last comment.

14 VICE CHAIR KLEINMAN: So I think that
15 we've worked very hard to describe the food
16 patterns or consumption patterns at all of the
17 different life stages that we've talked about.

18 But one way to integrate this is to talk
19 about how these patterns change over time, and
20 we've also examined health consequences at these
21 various life stages of the foods that are being
22 consumed, and that's another opportunity for

1 integration, if we look at cognition,
2 cardiovascular disease, and hypertension and the
3 various other outcomes, and look to see how these
4 relationships change over time as well.

5 So I think -- I liked what everybody had
6 to say. Jamy mentioned the generational aspect of
7 this, and I think we need to weave that into that
8 conversation about change over time.

9 And then I think it's really important
10 that we couch all of this as food as one of the
11 social determinants, but there are others, and to
12 the degree that we can link food consumption
13 patterns at least to some sense of economic status,
14 that will help us a lot in completing the story and
15 bringing it together so that we demonstrate where
16 the real opportunity here exists.

17 And I'll stop there.

18 CHAIR SCHNEEMAN: Well, these comments
19 are very helpful; I have been scribbling notes
20 here.

21 So I think at this point we're adjourned
22 for today. I'm looking at Eve. Do we need to

1 highlight anything?

2 So again, we will reconvene tomorrow
3 morning at nine o'clock. We have several more
4 subcommittee reports to go through, and then we
5 will have the period for public comment, which I'm
6 looking forward to.

7 So I hope you all have a good evening.
8 Thank you.

9 (Whereupon, at 4:28 p.m., the meeting
10 was adjourned, to reconvene at 9:00 a.m., Friday,
11 January 24, 2020.)
